

Five 1st Prize Medals recently awarded in open competition.

R. HALLIDAY & CO.,

HOTHOUSE BUILDERS and HOT-WATER ENGINEERS,
ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vineries, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm, from the smallest to the largest. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Sashes, Hotbed Boxes, &c., always in stock.

Plans, Estimates and Catalogues free. Customers wanted on in any part of the Kingdom.

Our Maxim is and always has been—

MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

MIDLAND COUNTIES HERALD

SUPPLIED FREE FOR SIX WEEKS, on stating the purpose for which the paper is required, forwarding Name and Address, and six halfpenny stamps for postage, addressed, "Midland Counties Herald Office, Birmingham." The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

Notice. **SUPERINTENDENT for FRUIT FARM**, in the CAPE COLONY.—Mr. CHARLES AYRES begs to inform the numerous applicants for the situation as above, that he has SELECTED a MAN, and to say that this advertisement will please be accepted as a reply to all communications.

WANTED, for Cape Town, South Africa, an ASSISTANT PLANT GROWER and PROPAGATOR, with good knowledge of Budding and Grafting. Age about 20; total abstainer preferred. Three years' engagement. Free passage by Mail Steamer. Salary commences £5 per month, and a rise second and third year. One used to Nursery Work preferred.—Apply immediately to Mr. CHAS. AYRES (of Cape Town), Henbury, near Bristol.

WANTED, an experienced GARDENER (Single-handed, with some help), for a garden of 2 acres. Not much glass at present, but thorough knowledge of Flower and Kitchen Garden requisite.—Apply to Mr. C. G. MOTT, Harrow Weald, Middlesex.

WANTED, a WORKING GARDENER, accustomed to grow Peaches, Tomatos, Flowers, &c. under Glass for Market.—Address, C. F. LEWIS, Henfield, Sussex.

WANTED, a MARRIED MAN, as SECOND GARDENER; experienced in Glass and Flower Garden. Good wages, and Cottage found.—Address, Z. WELBOURNE, Gardener, Holly Hill, Hartfield, Tunbridge Wells.

WANTED, a young MAN accustomed to growing Palms and general market plants, State experience and wages expected.—THOMSON'S NURSERIES, Spark Hill, Birmingham.

WANTED, a good PROPAGATOR, GRAFTER, and RUBBER, for medium-sized Nursery. Must have good references.—Apply to A. D., 8, Dunstan's Road, Forest Hill Road, London, S.E.

WANTED, a MAN of good character, for Outside Work, who thoroughly understands Pruning, Nailing of Fruit Trees, and Kitchen Garden Work generally. Wages, 17s. per week, both and vegetables.—Mr. SLADE, Clumber Gardens, near Workshop.

WANTED.—We are in immediate want of a skilful YOUNG MAN for our ORCHID DEPARTMENT; as also a good SOFT-WOODED PLANT GROWER.—References and state salary required, JOHN LAING AND SONS, Forest Hill Nurseries, London, S.E.

WANTED, for the Houses, a MAN well up in growing general stuff; abstanter preferred. Wages, 20s.—GEORGE PHIPPEN, Nurseryman, Reading, to whom please give particulars, age, &c.

WANTED, an energetic, steady MAN, as FOREMAN and SALESMAN, in a Nursery, near London. Good Grower, &c.—Apply, with full particulars, to P. MAHOOD AND SON, Nurserymen, Putney, S.W.

WANTED, a WOODMAN (WORKING).—A married man to act as Working Foreman in Woods for an appointment in Ireland. Apply, with full particulars as to age, experience, &c.—ARBORIST, Dickson's Nurseries, Chester.

WANTED, a MANAGER, for SEED, BULB, and NURSERY BUSINESS (Provincial House).—State wages required, with references, to L. K. Gardeners' Chronicle Office, 41, Wellington St., Strand, W.C.

Florists' Department.

WANTED, a smart young SALESMAN, capable of Managing the Department during the absence of the Buyers.—Apply at 5:30 P.M. to Mr. SCOOONES, W. Whiteley, Universal Provider, 159, Queen's Road, Bayswater, W. Close on Saturdays at 2 o'clock.

Seed Trade.

WANTED, a JUNIOR ASSISTANT, of good address. State all particulars, age, wages expected, and reference.—ALFRED PRITCHARD, Abingdon.

WANTED, a SECOND SHOPMAN, well up in Seeds, Bulbs, and Plants. State experience, age, and salary required.—P. S., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, an INVOICE CLERK.—Must be a quick Writer, and used to the Seed Trade.—Apply, by letter, giving all particulars, to WATKINS AND SIMPSON, 13, Exeter Street, Strand, London, W.C.

WANTED, a JUNIOR CLERK, with a knowledge of Shorthand.—Apply, stating age, experience, and salary expected, to LITTLE AND BALLANTYNE, Seed Merchants, Carlisle.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first-rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

To Gentlemen and Head Gardeners.

JOHN PEED and SONS have several young Men they can recommend both as FOREMEN in the Houses, or SECOND.—Nurserymen by Appointment to the School Board for London, Roupell Park Nurseries, Norwood Road, London, S.E.; also, at Mitcham Road, Streatham, S.W.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

SHOP ASSISTANT (SEED TRADE).—Age 20. Willing to Work in Nursery. Experienced inside and out.—J. J., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—Any dyspeptic suffering aware of the purifying, regulating, and gently aperient powers of these Pills, should permit no one to cloud his judgment, or to warp his course. With a box of Holloway's Pills, and attention to its accompanying "Directions," he may feel thoroughly satisfied that he can safely and effectually release himself from his miseries without impairing his appetite or weakening his digestion. This most excellent medicine acts as a nerve and bodily tonic by aiding nutrition, and banishes a thousand annoying forms of nervous complaints. An occasional resort to Holloway's remedy will prove highly salutary to all persons, whether well or ill, whose digestion is slow or imperfect, a condition usually evidenced by weariness, languor, listlessness, and despondency.

NURSERIES 400 ACRES:

VERY EXTENSIVE STOCK. Inspection Invited. Priced Catalogues Gratis & Post Free.

DICKSONS NURSERIES (LIMITED) CHESTER.

CHARLES NOBLE

HAS FINE BUDDED RHODODENDRONS, named kinds. ANDROMEDA FLORIBUNDA. AZALEA, finest Ghent kinds. Ditto, Seedlings. Ditto, MOLLIS, 10 to 80 buds. Ditto, OCCIDENTALIS.

DWARF ROSES, H. P., B., and TEAS. THUIOPSIS BOREALIS THUIA LOBBII Ditto, AMERICANA } 3 to 6 feet. CUPRESSUS LAWSONIANA HYPERICUM CALYGINUM. PORTUGAL LAURELS, 2 to 3 feet. HARDY HEATHS.

CLEMATIS, 3 and 4 years old. The General Assortment of NURSERY STOCK will be found superior in every way.

BAGSHOT, November, 1891.

FOREST TREES—FOREST TREES, COVERT PLANTS, &c.

JOHN PERKINS AND SON beg to call the attention of intending Planters to their large stock of the following, which for quantity and quality cannot be surpassed:—

- ASH, 3 to 4, and 4 to 5 feet.
- ALDER, 3 to 4 feet.
- BEECH, 2 to 3 feet.
- BIRCH, 2 to 3 feet.
- JUGLANS NIGRA, 4 to 5 feet.
- LARCH FIRS, 2 to 3, and 3 to 4 feet.
- OAKS, English, 3 to 4 feet.
- PINUS AUSTRIACA, 1½ to 2, and 2 to 3 feet.
- " LARICIO, 1½ to 2, and 2 to 3 feet.
- SCOTCH FIRS, 1½ to 2, and 2 to 3 feet.
- SPRUCE FIRS, 1½ to 2, 2 to 2½, and 2½ to 3 feet.
- SYCAMORE, 3 to 4 feet.
- BERBERIS AQUIFOLIA, 1 to 1½, and 1½ to 2 feet.
- BLACKTHORN, 2 to 3, and 3 to 4 feet.
- DOGWOOD, scarlet, 2 to 3, and 3 to 4 feet.
- HAZEL, 2 to 3, and 3 to 4 feet.
- HORNBEAM, 2 to 3, and 3 to 4 feet.
- LAURELS, common, 1½ to 2, 2 to 3, and 3 to 4 feet. " Caucasica, 1½ to 2, and 2½ to 3 feet. " rotundifolia, 1½ to 2, and 2½ to 3 feet. " Portugal, 1½ to 2, and 2 to 3 feet.
- PRIVET, Evergreen, 1½ to 2, 2 to 3, and 3 to 4 feet.
- FRUNUS MYROBALANA, 2 to 3, and 3 to 4 feet.
- ST JOHN'S WORT (Hypericum), strong transplanted.
- QUICK or WHITEHORN, strong and extra strong transplanted. Special offers on application.

52, MARKET SQUARE, NORTHAMPTON, Nurseries, Billing Road.

PAULS' NURSERIES, WALTHAM CROSS

BULBS & SEEDS

OF BEST QUALITY.

ALSO

MUSHROOM SPAWN, GARDEN MATS, MANURES, INSECTICIDES, and all other GARDEN REQUISITES.

Prices strictly moderate; reduced rates for large quantities. Inspection of stock invited. Goods packed by experienced hands for all parts of the world. Gardeners of character and experience recommended.

Important: Observe the Christian Name and Address—

WM. PAUL & SON, WALTHAM CROSS, HERTS.

NEW APPLE.

CHELMSFORD WONDER.

SALTMARSH & SON,

The Nurseries,

CHELMSFORD,

ARE NOW SENDING OUT THIS
SPLENDID

NEW KITCHEN APPLE

which, after receiving an Award of Merit, in March last, has had an additional award of a First-class Certificate, at the Meeting of the Fruit Committee of the Royal Horticultural Society, on November 10.

It is a firm, handsome Apple, of large size, a good keeper, great bearer, and of superior flavour when cooked. It was favoured with a well-executed illustration, together with a faithful description, in the *Gardeners' Magazine*, of April 11, copies of which may be had on application.

Strong Maiden Trees
are now ready, at

5s. each,

With the usual Discount to the Trade

PAUL & SON'S

GREAT HARDY NURSERY,
CHESHUNT, N.

Invite Planters to Inspect and Select from their Stock of

PAUL & SON'S CHESHUNT ROSES.

STANDARDS—Demand large. Early orders necessary.
DWARFS—Virtually all on the accepted stock—the Briar.
POT ROSES—The finest lot they ever held; therefore the finest in the world.
ROSE SPECIES and SINGLE ROSES—A specialty of the Firm.

PAUL & SON'S FINISHED FRUIT TREES.

STANDARDS, more especially APPLES, the very finest in the Trade. From £12 per 100 downwards.
PYRAMIDS, and all FORMED TREES, vigorous, and yet of best shapes.
All SMALL FRUITS, to ALPINE STRAWBERRIES, carefully tended.

Large Planters should see the Stock.

PAUL & SON'S HARDY TREES.

The variety of them is wonderful. By careful selection the smallest garden may be made a varied picture.
From 18s. per dozen.

PAUL & SON'S HOLLIES & EVERGREENS

Of every description, are moved and do well—notably Hollies, of which there are 8 acres at the Epping Forest Nursery, from 2 to 12 feet, 1s. to 5 guineas each.

PAUL & SON'S AMERICAN PLANTS.

The free-setting RHODODENDRONS and AZALEA MOLLIS—specialty at the High Beech Nurseries.

PAUL & SON'S CONIFERÆ.

The most varied collection in England. Special selections of ROCK GARDEN SHRUBS, and for Villa Gardens.
ARAUCARIAS in thousands, green and beautiful.

PAUL & SON'S HERBACEOUS AND ALPINE PLANTS.

For Borders, Rockwork, Cut Flower producing.

An acre of ROCK PLANTS at the Broxbourne Nursery.

ESTABLISHED 1807. Eighty-four years' continuous attention and application has made these Hardy Nurseries one of the most complete in Europe. Planters should see for themselves.

SATURDAY, NOVEMBER 21, 1891.

TOWN FOGS, AND THEIR EFFECTS.

Now that the fog season is approaching, we call attention to an important lecture on the subject by Dr. W. J. Russell, F.R.S., reported in full in *Nature*, November 5, 1891, and from which we extract a few salient points of interest to our readers.

The deposit analysed occurred during the last fortnight in February of this year (1891), and was obtained from the previously-washed glass roofs of the plant-houses at Kew and of some Orchid-houses at Chelsea. At Kew, 20 square yards of roof yielded 30 grammes of deposit. At Chelsea, the same area gave 40 grammes, which represents 22 lb. to the acre, or 6 tons to the square mile, and the composition of these deposits is as follows:—

Composition.	Chelsea. Per cent.	Kew. Per cent.
Carbon	39.0	42.5
Hydrocarbons	12.3	} 4.8
Organic bases (pyridines, &c.)	2.0	
Sulphuric acid	4.3	4.0
Hydrochloric acid	1.4	0.8
Ammonia	1.4	1.1
Metallic iron and magnetic oxide of iron	2.6	} 41.5
Mineral matter (chiefly silica and ferric oxide)	31.2	
Water, not determined (say difference)	5.8	5.3
	100.0	100.0

These analyses give, for the first time, a definite account of the composition of fog-deposit. Soot and dust are by far its principal constituents, rendered sticky and coherent by hydrocarbons. Mr. Thiselton Dyer says of the deposit, "It was like a brown paint, it would not wash off with water, and could only be scraped off with a knife. It thickly coated all the leaves of the evergreens, and upon what have not yet been shed it still remains." In the above analysis it is curious to note the large amount of metallic iron and magnetic oxide of iron.

We also learn from the Manchester Committee some interesting facts with regard to fog-deposits which occurred last winter in their city. This deposit, which was collected from *Aucuba* leaves, contained as much as 6 to 9 per cent. of sulphuric acid, and 5 to 7 per cent. of hydrochloric acid, mostly, of course, in a state of combination, but the deposit was, they say, "actually acid to the taste." Also that three days' fog deposited per square mile of surface, in by no means the worst part of Manchester, 1½ cwt. of sulphuric acid, and even as far out of the city as the Owens College, on the same area, over 1 cwt. of acid and 13 cwt. of blacks.

AMOUNT OF COAL CONSUMED.

A table shows an absolute increase, during the last fifteen years, of 2,000,000 tons of coal—that is half as much again is now burnt as was burnt in 1875. The coal consumed in London (that by gas companies deducted) amounted in 1889 to 6,390,875 tons.

Supposing only 1 per cent. of sulphur in this last yearly amount is converted into sulphuric acid (H_2SO_4), and passes into the air; this would give 195,720 tons of this acid.

FREQUENCY OF FOGS.

Between 1870 and 1875,	93 fogs occurred.
" 1875 and 1880,	119 " "
" 1880 and 1885,	131 " "
" 1885 and 1890,	156 " "

ATMOSPHERIC CONDITIONS.

The general atmospheric conditions which induce fogs are a still and moist air and a high barometer—a state of the air most usual under anti-cyclonic conditions. The immediate determining cause, however, of a fog is usually a sudden and considerable fall of temperature. Mr. Brodie also points out that last winter was a time of calms; the percentage of such days on the average for the last twenty years is 9.7, but last winter the number was 22. Emphatically, he says, it was an anti-cyclonic winter.

As to the influence of fogs on the death rate, Dr. Russell says it is beyond doubt that an atmosphere charged with soot, dust, and empyreumatic products is an unhealthy atmosphere to breathe; but the principal cause of the great increase of death when fogs occur is attributable rather to the sudden fall of temperature which usually accompanies fog, than to the fog itself.

ACTION ON PLANTS.

The deleterious action of town fogs on plants is more marked and more easy to investigate than its effect on animals. Nurserymen have long known from experience that a town fog will penetrate even their heated greenhouses, and with certainty will kill many of their plants, especially their Orchids, Tomatos, and, in fact, most tender and soft-wooded plants; but on this point Mr. Thibetson Dyer says in a letter to me: "With regard to plants under glass, the effect of fog is of two kinds: 1. By diminishing light; this checks transpiration. The plants are therefore in the condition of being over-watered. A well-known consequence of this is, to make them shed their leaves wholesale. Many valuable plants which ought to be well furnished with foliage become perfectly bare, and it is impossible ever again to recover them into slightly specimens. 2. The toxic influence of the fog is most striking. I attribute it in the main to sulphurous acid, though I cannot help suspecting that some hydrocarbon may also have something to do with it. The toxic effect varies from one plant to another, some are scarcely injured, others practically killed. If the visitation of last year is annually repeated, it must in time make all refined horticulture impossible in the vicinity of London." This fog action on plants is so clearly marked, and so deadly, that it has led the Horticultural Society, aided by a grant from the Royal Society, to undertake a scientific investigation of the matter. Plants are so much more easily dealt with than people, all circumstances of attack by fog, and its immediate results so much more easily noted and traced, that the investigation has already yielded important results, and we shall, I hope, hear from Professor F. Oliver—who is devoting himself specially to the investigation—some accounts

of his latest results. Marked difference between a town and country fog, is, that while country fog is harmless in a greenhouse, town fog produces most destructive results. The power of abstracting light depends principally upon the amount of coal products which the fog contains. Red rays can struggle through a fog absolutely impervious to the more refrangible ones. This opacity of town fog to light is one of its most serious and detrimental characters. Animals can no more thrive in semi-darkness than can plants, and, important as the red rays may be, still it is undoubtedly the blue rays which are most active in producing the principal chemical changes going on around us. It is not possible, I believe, for people to remain healthy where this source of chemical activity is cut off, or even seriously diminished. In addition to the loss of physical energy, mental depression is induced by absence of light.

Another action of light which is potent for good, is its destruction of many forms of bacteria. Professor Koch pointed out how his tubercle bacilli are killed by even a short exposure to sunlight.

DURATION OF SUNLIGHT.

Taking the totals of last year (1890), the hours of sunshine registered at Bunhill Row were 1158, at Greenwich, 1255; at Kew, 1405; at Apsley Guise, 1420; and at Eastbourne (one of the sunniest places in England), 1724. Comparing the amounts of sunshine at these places during November, December, January, and February, we find that at Bunhill Row there were 95.8, Greenwich, 150; Kew, 171.7; Apsley Guise, 205.9; and at Eastbourne, 268.3 hours of sunshine; that is, if Apsley Guise be taken as giving the normal amount, Bunhill Row received only half its due amount, and at Eastbourne there was nearly three times as much sunshine as in the City. Now on comparing the two other periods of four months which are comparatively free from fogs, the amount of sunshine is far more nearly the same at all stations.

Dates.	Bunhill Row.	Greenwich.	Kew.	Apsley Guise.	Eastbourne.
March till June ...	542.4	581.4	619.4	581.1	736.8
July till October ...	519.3	523.8	613.5	632.5	718.5

Mr. Raffles, during the winter of 1887-8 (which was remarkably free from fogs), found that looking south from Primrose Hill on 152 consecutive days, from November to March, only on 78 days could he see a quarter of a mile, and only on 83 days could he see the same distance in a south-westerly direction; this conveys a good idea of our London atmosphere. *W. Watson.*

(To be continued.)

NEW OR NOTEWORTHY PLANT.

ACAMPE MADAGASCARIENSIS, *n. sp.*:
AFFINIS *A. PAPILLOSA*, *Lindl.* (= *SACCOLABIO PAPILLOSO*, *Lindl.*)*

This is a curious little thing, of merely botanical interest—a Vanda-like plant, with thick leathery leaves, and a small flower-stalk of minute whitish

* *Acampe madagascariensis*, *n. sp.*: *Affinis A. papillosa*, *Lindl.* (= *Saccolabio papilloso*, *Lindl.*)—Sepalis oblongis lateralibus subfalcatis; petalis lateralibus linearibus angustioribus omnibus obtusissimis; labelli lobis lateralibus fere obsolete medio oblongo, margine nodulato basi callo v. linea transversa instructo disco verrucoso (nec papilloso); calcaris subcompresso oblongo obtuso $\frac{2}{3}$ ovarii aequante labello fere aequilongo intus piloso; gynoestemio brevissimo. anthera supra carinata, retinaculo lineari tenuissimo. Folia lorata crassissima, 3-4 poll. longa, $\frac{1}{2}$ poll. lata. Racemi brevissimi capitati, rhachis crassissima, bractee fere nulke, flores inter minimos generis, 3-4 lin. diametro, albidii, labellum roseolum.—Ex insula Madagascar importari jussit, Fr. Sander v. cl. Verulamensis. *Dr. F. Kranzlin.*

flowers, with a labellum of a faint rose-purple; that is all! notwithstanding, the plant is an interesting one. It connects the Indian species of *Acampe* with the newly-detected one in the south-eastern parts of Africa; it is the first *Acampe* known from Madagascar, and it shows that Indian types of Orchids also occur in Madagascar. There can be no doubt that it must be placed near *A. papillosa*, *Lindl.*, and *cephalotis*, *Lindl.*, with which it agrees in habit, and from which it differs only by some peculiarities of the very small flower. The author is indebted for the material to Messrs. F. Sander & Co., St. Albans. *Dr. F. Kranzlin, Berlin.*

ALDENHAM HOUSE, ELSTREE.

[SEE SUPPLEMENTARY ILLUSTRATION.]

THE fine estate of Henry Hucks Gibbs, Esq., M.P., on which over 100 acres are devoted to gardens and garden-kept pleasure-grounds, gives one of the best examples of good gardening in the county of Hertfordshire. Rich in noble old Oaks and Elms, and naturally beautiful, its beauties have been developed and increased to a great extent by the landscape work carried on of late years by Mr. Edwin Beckett, the gardener at Aldenham House. The latest, and by far the most marked improvement is the winding stretch of ornamental water running through the grounds as far as the eye can reach, its sloping grassy banks beautified by some of Pulham's best work in rockery, and which by its unartificial style and arrangement, converts the whole scene into such as one might witness in some lonely rocky glen and far away from the haunts of busy mankind. Over the upper part of the ornamental water a fine rustic bridge is thrown, capable of bearing heavy traffic, its base on either side being of massive rocks, among which are planted rare shrubs and flowering plants, the whole presenting a fine picture against the background of stately trees.

Further on another fine view is obtained, embracing a rocky bridge with a waterfall above it, and below the bridge after meandering through the tortuous rocky banks, it forms another waterfall into the lake below, a splendid view of two of the reaches being obtained from the stepping-stones which cross the water above the lake. From this point we are attracted by a brilliant mass of bright scarlet falling over the rocks below even to the water. It is produced by the scarlet climbing *Tropæolum* which here trails over, and forms an admirable and striking plant for summer effect. Still further away stretches this fine water scene among the rocky banks, until it is lost to the eye in the plantation of graceful Birch and other trees, and fine Conifera. Glancing along the more salient features in the plantings which cap and back the rocks, we observe that the masses of scarlet *Kniphofia* are very telling, and in one place the golden variegated *Privet*, and in another a mass of golden *Elder*, are bright and conspicuous objects; and here and there clumps of *Bamboos*, of *Gunnera manicata*, &c., are effectively arranged, while the planting of the lesser alpine and herbaceous perennials and Ferns have been well done. Above the banks irregular groups of *Thuias*, *Cupressus*, *Golden Yews*, and other ornamental trees have been planted. Some of the *Thuia gigantea*, which were moved from another part of the grounds, are over 30 feet in height, and their safe removal reflects great credit on Mr. Beckett, and speaks well of the efficacy of the lifting truck, which he has designed and had constructed for the purpose.

THE FLOWER GARDEN.

The entrance gates and new gardens beside them, arranged on the piece acquired by the extension on that side, form another great improvement quite worthy of the immense amount of labour bestowed on the work. From here the noble mansion appears at the end of the avenue of Oaks and Elms, and away to the right runs the terrace, with its vases of bright flowers at not too frequent intervals, and fine beds of flowers and shrubs. Close beside the gates are banks of *Privet* and other shrubs which it is

intended to always keep low, and along the terrace the large masses of mixed sunflowers edged with Mignonette, are very effective, and the great beds of *Lilium auratum* with an undergrowth of *Andromeda floribunda* edged with Heaths, are a grand sight. Permanent masses, too, of *Cotoneaster microphylla* edged with *Euonymus radicans*, and of other dwarf shrubs which retain their leaves in winter, have a telling effect. Following on we come to the drive planted with neat Conifers and shrubs, and about a mile in length, past the greater lake, and in its course disclosing many fine views.

At the south-east front of the mansion, which is on that side partially covered with *Crataegus pyracantha*, are the arrangements of bedding plants. The design composed of four oblong-square carpet beds alternating with three circular ones of the old white corolla *Fuchsia Madame Cornellisen*, makes a very

drives planted irregularly in clumps with *Hydrangea paniculata* now in full bloom; *Rosa rugosa*, and its white variety, with flowers, and their no less handsome orange-scarlet fruits; *Rubus laciniatus* which, in addition to being of ornamental foliage, supplies quantities of Blackberries; *Rhus cotinus*, a very effective shrub when covered with its white beards; clumps of golden Yews and of various Conifers, and shrubs of neat growth, and *Rhododendrons*, *Azaleas*, *Kalmias*, &c.

THE WALLED-IN GARDEN.

Both within and without the walls the fine crops of fruits and vegetables are well up to the usual standard at Aldenham. Within and without the walls, too, on the borders running around, and at the sides of the walks which meet at the ornamental fountain in the centre, are planted showy

walls, and forming one of the prettiest objects in the garden, is a mass of the Scarlet Flame *Nasturtium* (*Tropaeolum speciosum*), which for a long time refused to grow kindly here, but is now established, and not likely to give trouble again.

THE GLASS-HOUSES.

Commencing at one corner of the wall, and leaning to it, is a long range in several divisions, enclosing Peaches, Nectarines, &c., all well cropped; then come several large vineries, in which the bunches of the Muscat of Alexandria are large and well finished, while all the others are good. In one of the vineries the basement is filled with *Celosias* (Prince of Wales Feather) of a fine strain, worked up by Mr. Beckett, and which for elegance of form and brightness of colour are far beyond the average.

Fig-houses and Pine-pits follow, and, passing through the stove-houses, in which are some fruiting Bananas, some very fine *Eucharis*, *Stephanotis*, *Crotons*, and other plants fit for exhibition, we come to two houses chiefly containing healthy specimens of Orchids, whose blooms are arranged among plants in flower of white and red *Lilium speciosum*. Then follows a neat span-roofed range of glass in the first division, of which are *Dracænas* and other plants suitable for table decoration, perfectly grown; the next has a fine crop of Melons, with *Anthuriums* beneath, and in the third beautifully coloured *Crotons* and other decorative plants; and everywhere that perfect neatness and good culture which characterises the Aldenham House gardens is evident. J. O'B.

MR. OWEN THOMAS.

We are pleased to lay before our readers a portrait of Mr. Owen Thomas, who has recently been appointed Superintendent of the Royal Gardens, Frogmore, in place of Mr. Jones, resigned. Mr. Thomas's career at Drayton Manor, and afterwards at Chatsworth, is too well known to need more than reference. We wish him all success in the very arduous and responsible position he now holds, and trust that his duties at Frogmore will not prevent him from taking part in our metropolitan meetings.

BORDEAUX MIXTURE AND THE POTATO DISEASE.

MESSRS. BROWNS' EXPERIMENTS IN TYRONE.—Now that the results of the copper treatment of the Potato disease are beginning to appear, we all feel anxious to learn what has been the general outcome of them, especially from the practical standpoint of whether it will pay. At the early part of the present year I was in communication with Mr. R. Brown, of Donaghmore, Tyrone, on this subject, and am pleased to be able to report to the readers of the *Gardeners' Chronicle* the results of these experiments.

Although the tabulated statements do not cover so many folio sheets as do those of a recent experiment, which has been made public, yet they are sufficiently voluminous for our purpose. Nothing wearies the eye of the ordinary reader so much as page after page of statistics, so we will endeavour not to disgust any one who has sufficient interest in the subject to peruse the present communication. These experiments were made upon Champion Potatoes grown upon two different farms. The treated and untreated plots were close together, and identical as to seed, manure, cultivation, and so forth. I am given to understand by a gentleman who visited these experiments in the month of August last, that the plots selected were near the roadside, so that the effect might be the more easily visible to the passers-by.

We will take them in the order of time at which the dressing was first applied. The mixture was in all cases the same, viz., per acre:—32 lb. copper sulphate, 16 lb. lime, 160 gallons water. It was applied by an *Eclair Knapsack Pump* (price 35s.),

THE QUEEN'S GARDENER, MR. OWEN THOMAS.

fine display. The carpet beds, which are of elaborate design, are chiefly of the different coloured *Alternantheras*, and they are very bright; and the beds of *Fuchsias* are literally masses of bloom. Another set has the beds filled in with *Pelargoniums* and other flowering plants, the two most effective being those planted with the old *Calceolaria amplexicaulis*.

Passing the long stretches of covered walks on which the *Clematis* and other climbers mingle their flowers, we come to the Rose garden, enclosed by clipped Yew hedges, and so on to the subtropical garden, which, although good, is, on account of the wet season, not up to the mark of previous years. Bearing away to the left are the winding walks among rustic rockery, planted with Ferns, and a most varied and complete collection of Ivies; and running out into the pleasure grounds are long

herbaceous plants, among which the tall *Phloxes* are especially bright and profusely flowered here, as in most other places this season, during which they have not suffered from heat or drought as they do some years. Two large beds of that fragrant and profuse flowering white *Carnation Gloire de Nancy*, well display its sterling merits as a florist's flower. Here, too, the different varieties of perennial *Helianthus* have a fine effect, and the *Asters*, *Stocks*, and other annuals make a great show. One large border is planted with *Dahlias*, of which only the *Pompons* are grown, and beside the border, under the glass houses on one side, are the large army of *Chrysanthemums* grown up to the highest state of perfection, and with which Mr. Beckett will doubtless wage his usual successful warfare from the exhibition stands at the most important *Chrysanthemum* shows. On one of the

and the cost was about 10s. per acre, that is, 6s. for the Bordeaux Mixture, and 4s. for labour. Although in some cases heavy rain fell immediately after the dressing was applied, this did not apparently have any effect upon the result. The leaves of the untreated plots were destroyed by August 21, but the foliage of the dressed plots was quite green for nearly a month longer.

SUMMARY—PER ACRE.

Treated with Bordeaux Mixture.

	Ton.	Cwt.	Qr.	Lb.
Large Tubers	9	5	0	16
Small Tubers	2	14	1	0

11 19 1 16

Untreated.

Large Tubers	7	17	0	16
Small Tubers	2	8	2	8

10 5 2 24

Increase by treatment 1 ton 13 cwt. 2 qr. 20 lb., of which 1 ton 8 cwt. were large tubers.

Another experiment was made on the field of a small farmer; the crop here had been planted late, and but scantily manured. The result per acre was:—

	Ton.	Cwt.	Qr.	Lb.
Treated	7	3	0	0
Untreated	5	3	0	0

Increase by Treatment ... 2 0 0 0

Thus the increase by treating with Bordeaux Mixture was nearly 40 per cent.

The blue tint of the hydrated oxide of copper was quite visible upon the treated plots some days after the Bordeaux Mixture had been applied, and the difference in the amount of foliage was very

soon observable, and, of course, became more and more apparent as time went on. Whether at the present price of Potatoes a gain of a ton and a half in the one case, and of two tons per acre in the other, is worth the expenditure of 10s., I will leave the practical men to say. *Charles B. Plowright, M.D., King's Lynn.*

THE SEED TRADE.

THE SEASON'S PROSPECTS.—The prospects of the seed trade have, in the face of a season so hostile to the harvesting of seeds, a more than ordinary interest for all connected with the garden. Reports from the Pea districts in the Netherlands affirm that the crop is very good, though the early varieties suffered much from the rain. In our own country the yield is short, and the samples very much injured by continuous wet; the wrinkled varieties, especially, will require that nearly one-half of discoloured and imperfect seeds be picked out, in order to make the samples fairly good, and the choicer and more valuable varieties appear to be the worst samples.

Broad Beans are by no means plentiful, and good samples are scarce. On the continent, the report is that they are backward, owing to unfavourable weather, but otherwise good.

Dwarf French Beans are very late in being harvested, and the earliest varieties are expected to show the best samples. English Scarlet Runners, being extremely late, must show very bad samples indeed. In the Netherlands, Cabbage, Savoy, Swedes, and Turnips suffered severely from the effects of the extraordinary severe winter, but the plants which escaped produced fairly well. The yield of English Cabbage seed is very short, and the seeds much shrivelled, and the pods did not yield nearly what was expected. English Turnips show a fair crop; Swedes very short, and samples indifferent.

Of Mangel Wurzel seed there is very little indeed saved in this country, and continental crops are certain to be thin.

The harvest of foreign Onion seed appears to be better than at home, as it is believed the English crop is small, and the quality not good; and, therefore, prices are likely to rule high.

English-grown Carrot is reported to be nearly a total failure, and prices will, no doubt, be higher than for years past. Of Altrincham and Surrey, two popular long varieties, it is said there is scarcely any to be got. The continental crop, it is expected, will be a fairly good yield.

Radish is not yet threshed, but it is fully expected the yield will be a poor one, and this appears to be true of the foreign harvests also.

Spinach is fairly good at home, and certainly no better, even if as good abroad.

Leek seed is very scarce at home. Mustard plentiful, but Cress not so good.

The foreign crop of Cauliflower will be a small one, and there is but a poor yield in this country. The continental Parsley crop is near a failure.

On the whole, the outlook is by no means cheering, and there is reason to fear many small growers of seeds will feel the effects of short and unsatisfactory crops keenly. *Pisum.*

CHRYSANTHEMUM SPORTS.

[A paper read at the Conference of the National Chrysanthemum Society, November 10.]

(Concluded from p. 576.)

ALTHOUGH we have no direct control over climatal conditions, we can do what we like with the soil. We can impoverish it or enrich it, or supply any special ingredients we choose. Such undoubtedly affects the colouring of flowers, and apparently the power of sporting as well. To give one or two examples:—Mr. Hovey said,* that striped Dahlias will be best kept clean by planting them in a poor soil, while a rich soil invariably runs them. I believe this treatment is well known to florists, and generally

adopted for other plants as well. As another result of impoverishment, Mr. Lowe describes a number of sports of Chrysanthemum, as having been, as he surmises, actually caused by it.* "Two years ago I treated the plants badly; they were never potted off, and took care of themselves as best they could in an orchard; they never bloomed that year, and were all but killed. I cannot help thinking that this has been the cause of many of the sports."

A hint from Mr. Burbidge† corroborates Mr. Hovey's remarks on Dahlias, when writing about the fixation of sports:—"It is advisable to grow cuttings of sports in such a way as to ensure the full development of all the flower-buds they form . . . and so prove them to the core, as sports often revert to the parent type. Now to do this, it is advisable to grow them in a poor soil, without stopping . . . and to take care to give them no more pot-room than is needful for fair growth, but at the same time taking care not to starve them out of constitution."

I quote these few cases of the effects of a poor soil to show that growers have found out by experience, if not by experiment, at least something towards the production and fixation of sports. On the other hand, nutrition enhances the intensity of colorisation. A friend told me that he watered white-flowered Balsams with a solution of ammonia; by this means the plants bore red flowers. Mr. G. F. Wilson found that he could intensify the blue colour of alpine Gentians, growing, I believe, in a peaty soil at Wisley, by supplying them with lime. Chloride of lime has been found to cause a whole-coloured Camellia to become striped, &c. Mr. Claydon also found that Weigela changed from white to rosy-pink, according to the nature of the soil‡ These few facts are suggestive of experimentation, as the number of earths and salts, &c., which might be tried are innumerable. And since ingredients of the soil is the only one of all the circumstances which conspire to make up the plant's environment which is really in the power of the grower, it is clear that it is in this direction that experiments should be made.

Besides the colour, the form of the flower may be more or less completely altered in the sport. For example, Mr. Maries of Lytham, met with a case in which a sport appeared on Source d'Or, half the flower-head consisting of spreading, flat, canary-yellow coloured ray florets, while the other half of the flower-head was composed of recurved dark golden-bronze florets with revolute edges.§ As another illustration, Mr. Molyneux speaks of George Glenny (itself a yellow sport from the white incurved Mrs. Rundle), sporting to a true reflexed type of the same colour, in the garden of Mr. Horril at Havant. This variety is known as Mrs. Horril. Again, a true Anemone-sport occurred from the reflexed variety King of Crimson, and called Mrs. R. A. Mudie. Mr. Gallier of Edghaston, records how "a completely tasselled Japanese variety with pale pink or flesh-coloured florets, which were long, narrow and very full, arose as a sport from the fine incurved show pink variety, Miss Mary Morgan."¶

Lastly, Mr. Fortune remarked, "There is a curious circumstance about these plants which I must not omit to mention. Of course there were many varieties that I did not succeed in introducing; but, strange to say, many of these varieties were raised afterwards by Mr. Salter, of Hammersmith, from those I had introduced. An old lady, who lived near me in Kanagana, used to point to a number of varieties in her garden, and say that they all came from one and the same plant. I had the experience of Mr. Salter, and knew this was not unlikely. I think she was rather surprised when I said I fully believed her."¶¶

Similar experiences have been recorded in France. Thus M. Carrière mentions how a variety called

¶¶ *Gardeners' Chronicle*, January 17, 1880, p. 73.

* *Magazine of Horticulture* (quoted in *Gardeners' Chronicle*, 1812, p. 8).

Sophie bore flowers which were flat, having the petals narrow and imbricated, as well as flowers which were rounded; the petals being large and but little compact. As another instance, that author remarks that the variety Argentine, which is a Pompon, gave rise to a more vigorous branch, which bore large flowers, like the ordinary large-flowered *Chrysanthemum*. This may, therefore, have been a case of dissociation, the form Argentine having probably been a descendant from a cross between some form of *C. indicum* and *C. sinense*.*

This property, which might be described as the storage of forms and colours, strikes one as not only very remarkable, but practically suggestive. It seems as if a plant having been subjected to some new conditions, sports. The sport is propagated, and retains the character peculiar to the parent "in the blood," which enables it to revert. The sport itself sports again, and the latter now contains two forms in its constitution. It may sport again and so on, perhaps any number of times, and yet probably retain all the preceding sports latent in its constitution. Now, as *Chrysanthemum*s imported into this country have been grown from time immemorial in China and Japan, every variety may now be, for all we know, a sort of *mutum in parvo*, and the oftener one alters the conditions of the environment of those which have proved themselves to be most sportive, such as the so-called "families" of Queen Victoria, Princess of Wales, Duchess of Teck, &c., so much the more likely, as it seems to me, will fresh sports be produced.

Hence, it would seem from a study of sports, that the *Chrysanthemum* contains two means at its disposal. One is a force which causes the sport to reproduce an ancestral form which had existed before; a second, when, by a new combination of its internal forces, it produces an entirely new and original colour or form altogether. We cannot tell to which class a sport may be referred, unless we possessed every sport that ever existed, for comparison. But that no new sport can arise without some alteration in the surroundings, as ingredients in the soil or climate, I think all evidence concerning plant-life tends to show.

I do not mean to imply that the sport need immediately follow some alteration; for if we regard the formation of flowers as the result of forces, we know that forces may accumulate, lie dormant, or remain potential till circumstances occur which, so to say, liberate them. So that a new feature may take generations, for all we know, before it can make itself apparent; or an old character may lie dormant for ages.

Hence, to produce sports, the more varied the surroundings can be made; so, I believe, is the greater chance of sporting to be induced.

I have said nothing about intercrossing, this is too obvious a means of introducing changes in the offspring, but it stands altogether outside the limits of our subject, for sports are, strictly speaking, limited to "bud-variations," which appear on an individual during the course of its growth, and not in the seedling.

Consequently, I need not detain you with any remarks upon it; merely stating the two well-known laws of such propagation, viz., cross for variation, and self-fertilise for fixation.

Now let us examine the structure of the flower of the *Chrysanthemum* itself, and see how variations arise from it. Florists recognise several distinct forms. Starting from the original "single," or wild form, we have the ray and the disk florets, like a Daisy. The first change is the so-called "doubling." In this the disk florets become very similar to the ray. Now follow various details. If we examine a ray floret, we find it has a short tube, with a flattened limb of three petals only. If the tube is elongated, with little or no limb, the quilled form results. If the limb is enlarged, widened, and the tube is short, we get the recurved and the incurved forms, according as the flat piece bends outwards or

inwards. If the limb is very narrow and long, the Japanese actiniform varieties result.

Returning to the wild type we start afresh, and simply enlarge the disk florets. We thus get the Anemone form. If the ray becomes tubular like the disk, but enlarged, the number of the lobes to the corolla increasing, as in the Cornflower, the Dragon's-mouth variety is secured. If, however, we ask what causes all these differences to arise respectively, at present there is no reply, and, therefore, we do not know what steps to take to induce them to form respectively, until Nature herself has supplied the first indication of a change.

The first thing to do, if we want to discover a cause, is to look out for coincidences. If a sport appear, take note, and record in your note-book anything and everything you can observe as to the conditions surrounding that plant; find out its ancestry. It would seem desirable to note also the climatic conditions at the time, as sports of a like kind in plants, as we have seen, often appear simultaneously both in different places of the same county or counties, and also in different seasons.

It is only by accumulating coincidences that we can arrive at the first suspicion of a cause. When we think we may have discovered that a certain result seems to occur often or generally under certain particular circumstances; then is the time for experiments, to try and induce the same result to occur by artificially supplying those circumstances.

Practical men are often inclined to look suspiciously on scientific men as being too theoretical; but the reply is, that if only practical men would observe more, and record their observations, and then hand them over to the scientist, each party would, without doubt, benefit very largely by the other. The scientist has no such grand opportunities as the practical man. Thousands of facts familiar to the latter would be inestimable boons to the former, if only he could get at them. The practical man, unfortunately, does not always perceive their significance, but if every sport that has occurred on *Chrysanthemum*s had been recorded, coupled with the whole history of the plant and description of its surroundings, the method and kind of soil used, &c., as Dr. Masters suggested, whose remarks I have quoted above, I might, perhaps, at this moment have been holding forth on "The Causes of Sports, and how to Produce them," instead of being compelled to expose my ignorance by saying neither I nor any botanist, so far as I know, can yet tell you the why and the wherefore of bud-variation. *G. Henslow, M.A., F.L.S., &c.*

VEGETABLE PRODUCTS IN NEW GUINEA.

AMONGST the natural productions of the German possessions of New Guinea, many are valuable as drugs, for which it is expected an outlet may soon be found in the European markets, some having already come into commerce. On this subject the *Chemist and Druggist* makes the following remarks:—

"The long nutmegs obtained from the *Myristica argentea*, Warb., and locally known as Pala Papua, are the usual currency of certain parts of the country, and form, along with Massoi bark, the staple goods used by the natives in their barter with white traders. The root of *Derris elliptica*, Benth., is used as fish poison, while *Euphorbia pilulifera* is a common weed, which occurs as plentifully as it does throughout other parts of Polynesia and Australia. Although the natives know the Tobacco plant well, and were already cultivating it to some small extent before the arrival of the white man, yet singularly enough they give the name of Tabac to the fruit of *Carica Papaya*. A small-podded variety of *Capsicum longum* occurs wild, while *Anodendron Aambe*, Warb., is likely to become one of the most valuable products of German Polynesia. It is a new variety of rubber-yielding climber, which occurs largely in the new Lanenburg Archipelago, where its hard polished fibres are much

used by the natives; the capsules are from 4 to 5 inches long, tapering towards the end, blackish externally, and straw-coloured internally; the seeds are dark brown, elliptical in shape, flat, usually concave, broadest in the centre, with a flat base and with hooked point, from which springs a tuft of silky hair, about 2 inches in length. Both capsules and fruit closely resemble those of the *Strophanthus*."

CHEMISTRY OF THE APPLE.

COMPOSITION OF APPLE-TREE LEAVES.—Agricultural chemists throughout the world are, and have been for some years, directing their attention towards the solution of questions concerning the growth and bringing to perfection of plants and animals which serve for the use of man. With regard to plants, analyses have been made of all their parts, so that their composition is to-day pretty well known. But, as yet, it appears that little has been done in this direction for the aid of fruit-growers, and the reason is not difficult to find.

In all experiments of this nature, it is necessary to weigh and analyse an aliquot part of the final product of vegetable growth in order to arrive at the amount of plant-food absorbed from the soil and other sources; and, in this way, to ascertain the extent to which the soil has been exhausted, and the special elements which enter into the composition of plant tissues.

In the case of farm or garden crops, which are gathered annually, this is comparatively an easy task; but it is obvious that in the case of fruit trees, this, of necessity, cannot easily be done. As, however, it is as highly important to fruit-growers to know what kind of food, and what class of soils are best suited to yield the largest amount of fruit, as it is to the farmer or the gardener to be in possession of such information respecting his produce, it is but the duty of those engaged in working out these problems to direct their study so far as in their power lies towards the solution of such difficult questions.

It is with this view that Professor Shutt, M.A., of the Ottawa Experimental Agricultural Station, has directed his attention to the chemistry of the Apple. As time allows, he proposes to analyse the fruit, and the old and young wood of the tree; and from the data thus amassed, it is confidently hoped that the fruit grower will be able to ascertain with more or less accuracy the nature and amount of those fertilising elements withdrawn from the soil by the Apple tree in bearing. This will be the first step towards a more rational mode of applying manurial substances to orchards and garden fruit borders.

Professor Shutt says, it must not be thought that, even if we knew the exact composition of all the parts of an Apple tree (and as long as the fruit is hanging, it remains part of the tree), and the total weight of those component parts, and had also a knowledge of the composition of the soil in which the tree was growing, that the whole question would be settled. Until a few years ago, it was thought that such data were sufficient to guide the agriculturist and the horticulturist in manuring certain soils for certain crops, but later facts, evolved by patient experiments, conducted most carefully over many years, have now proved this theory fallacious.

We might illustrate this by reference to the cereal or grain crops of a farm and the Leguminosæ—Clovers, Beans, Peas, Vetches, &c. The former contain but one-half of the nitrogen of the latter, yet, notwithstanding this fact, and all that it seems to imply, it is found that the application of nitrogen as a manure is specially beneficial to the grain crops, but of little or no value to the Leguminosæ, especially after a certain stage of their growth. Without going into the theories which have been advanced to account for these facts, we must understand that we have to draw upon the soil, the air, and the water, or rain, for the constituents of plant-food, and the soil, generally speaking, is the only one of the three we can modify or alter in com-

* The real name appears to be *C. monfolium*.

position by mechanical and chemical agents. The climate, including degree of frost, amount of rainfall, snow, sunshine, &c., all these are important factors in horticulture and fruit growing.

But as we have no control over the atmospheric elements, the line of experiments seems rather in making choice of and multiplying from such varieties, whose qualities, dependent upon heredity and environment, make them especially adapted to the climate in which we are placed, and thus finding out by all the means at our command, and applying those constituents of plant-food best suited to their growth and development.

In the experiments of Professor Shatt, five well-known and hardy varieties of Apple trees were selected, and for the purpose of investigating the constituents which composed the leaves, these were gathered at two stages of their growth, viz., May 25 and September 20 in the same year.

Upon the first date the specimens represented leaves in a very early stage of development. On September 20, all the leaves were still quite green, and their life apparently unimpaired and vigorous. The following list gives the names of the Apple trees experimented with:—No. 1, Duchess of Oldenburgh; No. 2, Tetosky; No. 3, Wealthy; No. 4, Fameuse; 5, Northern Spy. And the appended table shows the chemical composition of the Apple tree leaves, together with such other data as may help to elucidate the questions under consideration.

The first portion of the following table represents in parts per hundred the average composition of the Apple leaf—the water, the organic matter, the mineral or ash constituents, and the nitrogen in the organic matter. The second portion shows the average percentage of the chief inorganic components of the ash. The third portion gives the average amounts of nitrogen, phosphoric acid, and potash contained in 1000 lb. of the green leaf, which serve to illustrate the absolute and relative values of the Apple leaves as a fertiliser, as well as to show the quantities of these materials abstracted from the soil by the growth of the tree foliage.

ANALYSES OF APPLE TREE LEAVES.

Composition of the Leaf, and percentage Composition of Important Constituents in the ash.

Description.	When gathered.		Difference.
	May 25.	Sept. 20	
Moisture	72.36	60.71	Loss, 11.65
Organic matter	25.31	35.83	Gain, 10.52
Mineral matter (ash)	2.33	3.46	Gain, 1.13
Nitrogen in organic matter	2.94	2.48	Loss, 0.46

Selected Constituents in the ash.—Per cent.

Phosphoric acid	10.47	5.82	Loss, 4.65
Potash	10.82	11.63	Gain, 0.81
Lime	17.40	27.91	Gain, 10.51
Magnesia	9.77	4.81	Loss, 4.96
Oxide of iron	1.49	1.41	Loss, 0.08
Silica	1.07	1.14	Gain, 0.07

Weight of Fertilising Constituents in 1000 lb. of Leaves.

	Lb.		
	May 25.	Sept. 20	Difference.
Nitrogen	7.12	8.87	Gain, 1.75
Phosphoric acid	2.45	1.94	Loss, 0.51
Potash	2.52	3.92	Gain, 1.40

We see from the foregoing data that there is from the one period to the other a loss of moisture and of nitrogen, with a gain of organic matter and of ash, which is due to increased growth, to maturation, and to increase of woody fibre in the leaves.

In order that the tree may carry on this accumulative process and produce fruit at the same time, it is absolutely necessary that it find within the soil a sufficiency of available plant-food for its use. We leave the further consideration of the subject to a future paper. *J. J. Willis, Harpenden.*

THE FLOWER-BEDS IN HYDE PARK.

EARLY in September last, in fine weather, on visiting Hyde Park, I made some notes on the style of bedding practised there; knowing that what is there carried out has a good deal to do with the fashion of other flower-beds and borders in many a fair flower garden all over the country. It is not the excellent manner in which the beds are planted and maintained which induce favourable impressions on visitors—it is the many charming ways in which the plants are disposed of, from the majestic Palm down to the lowly blue Lobelia and *Spergula pilifera* aurea, that specially attracts attention, and excites a spirit of emulation in the minds of the possessors of gardens who frequent the park during the "season," and who note the kinds of plants that please them most, and the excellent manner in which the "solitaire" and specimen plants are disposed on the turf or in the beds. My remarks on the subject which follow may prove of interest and usefulness to not a few of the readers of the *Gardeners' Chronicle*, who may not have had the opportunity of seeing the bedding-out in this park and others in and about London.

Roughly speaking, the dimensions of that portion of the Hyde Park between Stanhope and Grosvenor Gates, in which the flower-beds herein referred to are situated, are about 400 yards long and 30 yards wide; and this space is enclosed by a low wire fence, and bounded on one side by the carriage-drive (which encircles the park), and a broad walk, whereon seats are placed at short intervals, and on the other by Park Lane. In this strip of green turf there are three rows of circular and oblong beds, of uniform size, situate opposite one another, and a short distance apart, with a broad walk dividing the second and third (next Park Lane) rows of beds; large Palms in variety being disposed with excellent effect along the border of turf which extends between the first and second rows of beds for the entire length of the strip, with a fine plant of *Phormium tenax variegatum* at the Grosvenor Gate end. The pots are in all cases plunged beneath the soil. Foliage and flowering plants (the latter with the shoots tied out to green sticks), are also employed in the same manner, and with great advantage, as an irregular background to the beds next Park Lane. Among the flowering plants so used (in groups, may be mentioned the Coral Tree (*Brythrina cristagalli*), pyramids of *Cobaea scandens variegatum*, *Pelargonium Madame Crousse*, showing its large trusses of magenta-coloured flowers to great advantage; *Plumbago capensis*, *Fuchsias*, *Petunias* (single flowers), blue *Clematis*, Sweet Peas (apparently Eckford's excellent varieties), a *Begonia* of the manicata type, and large plants of scarlet and pink-flowered *Pelargoniums*. The composition of the beds, as noted in my stroll from Stanhope Gate to Grosvenor Gate and back, is as follows:—Oblong beds filled with pyramids of *Madame Crousse Pelargoniums*, *Liliums*, and *Carnations*, set in a ground-work of yellow *Violas*, with a broad band of *Coleus Verschaffeltii* and an edging of blue *Lobelia*. The next set of similarly-shaped beds were filled with pyramids of *Nasturtiums*, *Campanulas*, *Daturas*, *Calceolaria amplexicaulis*, and *Lilies*. Circular beds having double-flowered *Begonias* planted in a ground-work of *Mesembryanthemum cordifolium variegatum*, with a band of the dark-foliaged *Iresine Lindenii*, and edged with a dwarf golden *Fuchsia*, were very effective; as also were beds filled with pyramidally-trained *Fuchsias*, dark and light colours, set in a carpeting of blue *Viola*, and edged with blue *Lobelia*. Circular beds, studded with pyramids of a very dark flowered *Heliotrope*, encircled with *Coleus Verschaffeltii* and fringed with *Lobelia*, perfumed the air with its delicious odour, especially during the early morning and in the evening. Beds carpeted with blue *Pansies*, and dotted with *Fuchsias* from 3 to 4 feet high, of the *Madame Cornellisen* type (red and white), with an inner band of *Coleus Verschaffeltii*, and edged with *Lysimachia nummularia aurea* (*Golden Moneywort*), made a nice contrast to the beds previously

mentioned, as also did the beds filled with yellow-flowered *Chrysanthemums* and dark-foliaged *Coleus*, and edged with blue *Lobelia* and *Alternanthera polygonoides major*; *Canna*s intermixed with *Lilium auratum* and *Campanula pyramidalis*, with a band of blue *Lobelia*, another of *Iresine Lindenii*, and finished off with a good broad edging of *Mesembryanthemum cordifolium variegatum*, made very pretty beds; and the same may be said of *Abutilon Thompsonii*, set in a ground-work of *Coleus Verschaffeltii*, and edged with the popular blue *Lobelia*. Four circular beds—two being on either side a cross-walk, about mid-way between the gates mentioned above—filled with well-flowered plants of single red *Begonias*, encircled with a 12-inch wide band of variegated *Mesembryanthemum*, and finished off with *Echeveria secunda glauca*, had a very telling effect. I may remark that, among the beds described were interspersed several good examples of carpet-bedding, the designs, selection of plants, arrangement of colours, and the keep, being everything that could be desired—creditable alike to the park superintendent and his staff. These remarks also apply to the sub-tropical work so effectively carried out in the neighbourhood of Knightsbridge Barracks and the Serpentine. *H. W. W.*

THE STRUGGLE FOR LIFE IN THE GUIANAN FOREST.

(Concluded from p. 579.)

HAVING provided a guard against crawling vermin, the *Coryanthes* proceeds to develop a most wonderful flower, in which every part is obviously formed to attract a particular insect. The majority of insect-fertilised flowers are grateful for the visits of either bees, butterflies, or flies, but not so the *Coryanthes*. It has laid itself out only to catch and utilise, without hurting it, a beautiful metallic-green bee (*Euglossa aurata*). From the base of one of its pseudo-bulbs, a long flower-stem is produced, which pushes itself straight downwards. Upon this it hangs a number of beautiful cups, into each of which a liquid drips from two horn-like processes in the upper part of the flower. Take a china tea-cup, with a spreading mouth, hang some little flags over the handle, and stick a model of the figure head of a Polynesian canoe opposite, and you have something like one of them, as it opens itself in the early morning from a bud resembling the swathing of a Chinese lady's foot. The species vary in colour and markings, being generally whitish, or yellow, blotched and spotted with crimson. Their odour, as judged by our standard, is not pleasant, but, nevertheless, it is very attractive to the bees, which, immediately on their opening, swarm round in great numbers. Flying towards the flower, as a moth to a candle, the bee falls into the liquid which covers the bottom, and wetting its wings, is unable to use them. Look into the cup, and you will see a dozen bees swimming round and round, or vainly trying to climb the slippery sides, and, if it is the second day after opening, one or two may be seen drowned. It was never the intention of the flower, however, that their lives should be sacrificed, but on the contrary, that they should escape, and in doing so perform the office for which the whole contrivance has been arranged. Under the flags, where the column comes near but does not actually touch the cup, is a narrow opening, through which the bee can push its way out. In doing this it has to use sufficient force to widen the gap, which opens like a spring door, when it comes in contact with the pollen case, ruptures it, and carries off the male organ on its back. Not being able to fly, there is nothing to be done but to crawl over the flower spike, where, heedless of its former trouble, it soon finds itself inside another flower. In making its way out, the pollen masses are rubbed on the stigma, and the ovary fertilised, after which it may carry out the pollen masses of this flower in turn to fertilise another.

In observing these wonderful contrivances, of which almost every genus of plants furnishes ex-

amples, we are struck with the thought that there must be something like consciousness in some at least of the higher species of plants. What can be more like reasoning than the fact that Orchids and many other plants have provided against so many contingencies, some of which may not occur during the lifetime of the individuals? Some of these contrivances do not show a very high standard of morality. It is rather hard upon the butterflies, for instance, that an Orchid should take care to warn them off during the larval stage, while it cordially invites them when they suit its purpose. It seems to say, "I will have no ugly crawling worms depending on me, but you may come to my wedding, and have a sip of the nectar, when you also have on your holiday dress." In the struggle for life, there is not the slightest gleam of anything like benevolence, but on the contrary, selfishness and greed are most prominent. If a flower provides food for the perfect insect, it is simply because in doing this, the plant derives a certain advantage. There is a continual

selection is continually at work in the forest, the result being the innumerable variations which attract the amateur orchidophile.

Another side of the struggle for life is exemplified on the sand reefs. Extending for miles, large expanses of white ridges vary the monotony of dense forest and stream. Here and there, between clumps of low bushes the open spaces glare with reflected light and heat, while the sand itself is so hot that the bare-footed Indian is obliged to peel two pieces of bark to protect the soles of his feet against it. Without such an excessive rainfall as that of Guiana, these reefs would be quite barren, but under the circumstances, the hardier shrubs and a few trees manage to exist. Orchids abound everywhere upon the low shrubs, while several genera have succeeded in accommodating themselves to the sand itself. Here is a *Cyrtopodium*, with a magnificent panicle of yellow flowers, but what a fine pseudo-bulb is this! 3 to 4 feet long, and thick and fleshy, it contains a store of food against all contingencies. Unlike its relations

FIG. 84.—CHELMSFORD WONDER: YELLOW, SPOTTED RED.

straining of the insect to over-reach the plant, which in its turn does its very best to prevent this. The plant elaborates bitter, noxious and poisonous secretions, but notwithstanding this, some larva or other succeeds in almost every case in overcoming the difficulty. There is hardly a vegetable poison that cannot be eaten by some larva or other, and we may reasonably presume that, as the plant concentrates its deleterious secretions, the insect develops its digestive powers to meet the difficulty.

The Orchids, above every other class of plants, are examples of the highest individuality. Even the most casual observer will notice that if he has half-a-dozen plants of one species, they all differ from each other in colour, markings, size, and shape. Every plant is an individual as well as a species, this characteristic being very prominent in nearly all tropical plants. Entirely apart from the environment of the particular plant, which necessarily produces diversities in vigour and size, every Orchid may be known and recognised as easily as one of his flock by the shepherd. By artificial selection, desirable varieties of so many garden flowers have been perpetuated, but in the case of the Orchids natural

of the tree-tops, it revels in the glare, only partially screening itself beside the bushes. *James Rodway, F.L.S.*

CHELMSFORD WONDER APPLE.

THIS Apple was raised from seed by the son of a mechanic some twenty years ago, in a cottage garden in the neighbourhood of Chelmsford, but of its actual parentage nothing is known. In appearance, the fruit partakes somewhat of that of King of the Pippins, but it is larger and more solid, being adapted on that account only for culinary purposes, whilst its foliage and habit of growth resemble more closely that of the Blenheim Orange, though in young trees it is more erect, and might well be taken for a cross between those two excellent varieties. The tree is a free bearer, never having failed a good crop for the past ten years, and the fruit keeps firm up to April or May, and does not shrivel easily from exposure to the air. When cooked it is of excellent flavour, and may be used from the present time to the end of the season. Our illustration (fig. 84) is taken from a specimen which received a First-class Certificate from the Fruit Committee on November 10.

A THEORY OF HEREDITY, BASED ON FORCES INSTEAD OF ANY SPECIAL FORM OF MATTER.

SYNOPSIS of a communication to the Linnean Society, November, 1891.—Why and how forces produce hereditary effects, are beyond discovery; but it is maintained that no special form of matter (as is generally supposed) other than protoplasm is required. The latest discoveries of the organised structure of protoplasm militate against the idea of any other special form of matter.

Universal vegetative multiplication shows that every plant-cell must contain the supposed special matter (e.g. "germ-plasm" of Dr. Weismann) if it exist.

Illustrations.—1. *Animal.*—Two varieties of chickens are fed from the first day to full growth on the same kind of food: why are they different? It is more probable that the results are due to different arrangements of the same kinds of molecules than that they are due to different kinds of "germ-plasm."

2. *Vegetable.*—*Ranunculus heterophyllus* produces a land-form and a water-form, according to its environment. It therefore exhibits both "heredity" and "acquired characters." As the materials of its structure are the same in both cases, the different results must be due to different arrangements of its molecules. This must be effected by forces. In both cases it establishes an equilibrium between itself and its environment. The general effect of water on plants is degeneracy. The sudden appearance of stomata on the land-form, illustrates a case of forces normally "potential" while the leaf is submerged, becoming "actual" when the leaf develops in air.

Further Deduction.—Aquatic plants are degenerate forms of land plants. This deduction is established (1) by experimental verification; (2), by comparative morphology and anatomy.

The formation of submerged and floating leaves is the result of self-adaptation to the environment. Such are now hereditary.

Predispositions Considered: How Arisen.—Illustrations of predispositions:—Sir J. Paget on cancer; Dr. Weismann on Myopia; hereditary blindness in a cat.

Responsiveness of Protoplasm.—Illustrations of the action of the innumerable forces in the construction of the human body and soul. The soul compared to light.

Conclusion.—Protoplasm and the forces bound up with it are perfectly able to do all the work of transmitting parental characters, as well as to acquire new characters, which in turn may become hereditary as well. *G. Henslow, M.A., F.L.S.*

THE BULB GARDEN.

THE HIPPEASTRUM.

THESE plants have now quite finished their growth, and whether their cultural requirements are better understood, or the season has been favourable to them, I do not know, but they certainly have matured well, notwithstanding the unfavourable autumn.

During the last week in October, or some time in November, the entire collection should be taken out of the plunging material; and the bulbs ought to be cleaned from the outer skins, under which may perhaps be lurking insect pests of various kinds, such as thrips and mealy bug. To make sure that any examples of these troublesome parasites are destroyed, I dust the bulbs over with tobacco-powder. They are also kept dry at the roots, and placed in a greenhouse temperature, with a dry atmosphere and plenty of ventilation, until it is time to repot them in January.

The leaves ought to be removed now from all except the seedlings of the present year, which may yet be kept in a growing condition. These young seedlings do not lose their leaves in winter, and it is necessary to give them enough water to prevent their flagging. The best place for them at present

is an intermediate-house, where the temperature would not fall lower than about 50°; and it is better to place the plants near the glass roof on the sunny side of the house. When potting them in January or February, three plants may be set in a 6-inch flowerpot, and to promote root-action and start them on at once, let the pots be plunged in a bed of some fermenting material—spent tan is best, as this does not become over-heated. This is the right time to see that the wood and glass-work of the house are washed; a little soap only should be used in the water, as too much soft-soap causes the paint to come off, and it has also a tendency, I fancy, to dull the glass. The bulbs must be kept out of the way of the water.

The question was asked the other day by a grower who does not raise seedlings, "How many good varieties were obtained from a hundred seedlings?" Such a question cannot be answered right off, for a great deal depends upon what the parents are from which the seeds have been obtained. I have noticed, that if seeds are obtained by cross-breeding two distinct original specific forms, the seedlings are nearly all alike, and intermediate between the two parents; this method of cross-fertilisation is the first, as it is the best, way to obtain garden varieties of plants or trees. If a garden variety and an original specific form is crossed, there is greater variation in the seedlings; but if we hybridise two garden varieties removed several generations from the original hybridisation of two species, we obtain a much greater variation in form and colour, and the cultivator who thoroughly understands the work in which he is engaged, and has a knowledge of the various points of excellence, such as form and colour of the flowers, the number of flowers on a scape, habit and constitution of the plant itself, &c., will be sure to excel.

As we go on towards perfection, we find the more highly-developed flowers are not so prolific as seed bearers; but it is necessary to select them as pollen and seed bearers. A flower with such excellent qualities as good form and substance of petal, and with a vigorous constitution, may be chosen as a seed bearer, even if the colour is not satisfactory, for this may be secured to the progeny by the selection of a well-coloured pollen-bearer. The number of good seedlings may be determined by the wisdom displayed in the selection, but at least 10 per cent. of really good varieties may be expected; whereas in raising seedling Auriculas we should be glad to obtain 1 per cent. The only way by which I can account for this difference in results is, because the Auricula has been brought to such a high state of perfection through so many years' cultivation. *J. Douglas.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

WINTER TOMATOS.—The winter-fruited plants should have every attention to get a good set of fruit before the short days of winter set in, and to do this with so little sun and much rain more difficulty will be experienced. The foliage must be kept thin, and the plants near the glass. More warmth will now be required and the house kept drier, airing freely in the daytime, and having a chink on at night. These plants will now do with much less moisture than is usually given them, for excessive supply is the for-runner of disease. The most suitable way to fruit these plants is to grow them to a single stem, and thus get the trusses close together. These should be gone over daily, and the blooms fertilised with a camel's-hair brush. Feeding should take place when a good set has been secured: I find Thomson's Vine Manure excellent for winter Tomatos. The Old Red is one of the best for winter work; it sets more freely than the smooth round kinds, and when grown in pots the plants make a starchy growth. If white-fly is troublesome, apply flowers-of-sulphur with a duster, and treat as advised in a previous Calendar. Plants struck from cuttings some weeks back should get a saift and be kept near the light, giving the roots a little assistance by plunging in a mild bottom heat for a short time, airing freely from

the top ventilators to keep them sturdy, and when potting to make the compost firm and not too rich.

STRAWBERRIES.—With heavy rains these plants will now require shelter, and though I do not care to take them into houses that are at times warm to keep out damp, it is time they were in their winter quarters. The best place is in cold frames, or in an unheated fruit-house. If cold frames can be afforded them, it is much the best, as the crowns are near the glass, and thus get all the light possible, with plenty of air and free exposure in mild weather. If the pots are placed in frames, they should be plunged to the rim in ashes or Cocoa-fibre; if in a house, keep the plants to the front as much as possible, and do not let the roots suffer from dryness, but avoid excess of moisture. Those plunged in frames will not require water for some time; but when in fruit-houses, with free circulation of air, they dry more freely. Without frame convenience, the plants may be plunged in the open in ashes. The late forcers should be left as long as possible. Before housing, we stack ours, and in ordinary winters they do well; but with winters like the last, they require more protection to keep the roots from injury. Therefore, when stacking, it is best not to build too high, also to face north and south, as the east wind after frost, is worse than frost, and use plenty of material between the pots. *G. Wythes, Syon House, Brentford, W.*

PLANTS AND THEIR CULTURE.

FORCING-PITS.—In this department great foresight and thought will now be required in bringing forward the different kinds of plants, bulbs, &c., so as to provide a succession of blooms to furnish the conservatory and greenhouse, and also for providing cut flowers. Some of the early-potted Tulips and Paper-white Narcissus should be examined, and when well rooted bring them into this structure, in batches, so as to form a succession, according to the requirements. Well-ripened clumps of Lily of the Valley should also be introduced; plunge them in Cocoa-nut fibre refuse, where the bottom-heat can be kept from 75° to 80°, and the temperature of the structure from 80° to 85°. Keep them dark until they have commenced to throw up their flower-spikes, when they should be kept well up to the light. Single crowns may also be planted in boxes filled with Cocoa-nut fibre refuse, when required for cutting purposes, as by so doing space is greatly saved.

A few clumps of Christmas Roses, *Helleborus niger* var. *angustifolius*, should be brought forward, as they will be found very useful about the end of the year; also roots of *Spiraea japonica*, *Dielytra spectabilis*, and Solomon's Seal (*Polygonatum*); the two last-named, where cut flowers are used, should be grown in quantity. A few plants of *Deutzia gracilis*, Charles N., Lilac, and *Syringa persica* should also be introduced, and kept in a temperature fluctuating between 60° and 65°. Should the flowers of the last-named be required white, the plants should be forced in the dark.

CAMELLIAS.—The present is a most critical period in respect to these plants dropping their buds, and care must be taken not to allow the soil or the atmosphere of the house to become too dry. On all favourable occasions slightly dew the plants overhead with luke-warm water. Any late plants which have set their buds thickly, and have not been disbudded, should have attention, and assist any plants which are pot and tub bound with some well-ripened fertiliser. Keep the foliage thoroughly clean by frequent sponging, but do not use any kind of insecticide at this season of the year, as it is liable to injure the buds, and be the cause of them falling; but rather use clear soft water, which will be found much safer, and quite as efficient. *T. W. G., Finch Cuth, Easton.*

THE KITCHEN GARDEN.

ASPARAGUS.—Roots that are being forced should be examined carefully daily, to see that the heat is not excessive. Should the temperature be too great, holes of 2 inches in diameter must be made in several places, to allow the excessive heat to escape. A small amount of air may also be afforded the pit during the night, when the crowns begin to push above the soil. Abundance of light and air should be given on fine days, so as to secure a green, crisp head.

If necessary to make new beds of Asparagus, the work should be commenced by deeply trenching the ground, and upon light sandy soils a large quantity

of good manure should be worked into it. If cold and clayey, the sand must be well drained, and additions will have to be made that will render the rooting more lasting. The best materials for improving clayey soils are well-burnt garden refuse, road grit, decayed leaf-soil, and the clearings of ditches. The time to commence the making of extra beds is usually when those established show signs of degenerating, or when plantations are lifted annually for forcing.

MUSHROOM-BEDS.—Beds in the open air should be carefully examined, and if the covering materials are wet, they must be carefully removed and replaced with drier stuff, keeping the beds from exposure as little as possible. See that the beds are thoroughly covered again to a good thickness, and made as far as possible water proof. Continue to collect fresh materials, drying and preparing them under cover, to make up new beds in the Mushroom-house in place of others which have ceased to bear.

GLOBE ARTICHOKE.—For protection against severe frosts, some dry light material should be placed around the base of the leaves, having first removed dead and decaying foliage from the plants.

THE FRAME GROUND.—Materials should be got together in readiness for making up hotbeds; fresh litter from the stables and good Oak or Beech leaves well mixed and turned before using are most suitable for the purpose. Cold frames containing Endive, Lettuce, and Cauliflower should be made secure from frost by lining the outsides with some kind of litter, or by banking the soil up around them; extra coverings in severe frost will also be necessary on the glass. All such frames should be freely ventilated. The plants also must be looked over frequently, and all decayed matter removed, and the surface of the soil between them kept stirred. Any appearance of mildew among Cauliflower plants should be at once checked by light dusting of flowers-of-sulphur.

STORE ROOTS.—Look over stores of Potatoes, Onions, and all other root crops, removing all signs of decay, and sorting them to suit future intentions in regard to each. *C. J. Waite, Glenhurst, Esher.*

THE ORCHID HOUSES.

THE CATTLEYA-HOUSE.—Too much cannot be said in drawing attention to the reintroduction of the autumn-flowering varieties of *C. labiata* that are now being sold in quantity at very moderate prices. This brings the whole of the *C. labiata* within reach of the amateur and small growers. In large collections the *C. labiata* will always remain in bloom from year's end to year's end. That these plants are of a good constitution, and free in flowering, a first-year's growth will prove; we find that they do well when placed with *C. Mossiae* and *C. Mendelii*, and potted in a compost of three parts fibrous peat to one of sphagnum moss, with some broken pieces of potsherds intermixed. We have been re-arranging our plants of *Laelia anceps* varieties, so that by staking and tying the spikes of flowers gradually, we may obtain the whole of the flowers to face a given point; this adds materially to the beauty of the flowers, as each bloom can be seen in its entirety.

The watering of the Cattleya should only now be done by those who have some practical knowledge of the requirements of the plants, as each plant must be considered individually. Plants that are in small pots or baskets will require much more attention in this respect than those that have been repotted during the past summer. Although I do not advise the drying up of Cattleyas at any season sufficiently to cause the pseudobulbs to shrivel, yet to rest the plants efficiently they must be kept on the dry side for some weeks; this allows the temperature to be so reduced, that the rest necessary is compulsory. This must, of course, only apply to those plants that have finished the season's growth, or the plants would suffer from being thus treated. Any late-growing kinds should be placed in a warmer house, to swell off and perfect their growth; they may then be brought back, and treated as above.

THE INTERMEDIATE-HOUSE.—*Vanda suavis* tricolor, and, indeed, the whole of this section of Vandas, should be kept on the dry side from now to the end of February. These plants delight in a cool-house and a long rest; at the same time the atmosphere must be kept moist, which will keep the leaves plump and hard. The best way in which

to test whether moisture is required at the roots is by feeling the bottom foliage of each plant; when this softens, and shows signs of shrivelling, water should be given, but then sparingly, or the roots that are enclosed in the pot are apt to suffer. Another plant that must be kept dry for a long season is *Odontoglossum citrosum*; this plant can hardly be induced to flower, no matter how large the new pseudobulbs may be, unless a long season of rest is given. The new growth should now be about finished; if this is so, on examination of the plants, then they should be placed in a light position near the glass, and no water given at the root until the back bulbs are seen to be shrinking. To get these plants to bloom freely, it is better to err on the dry side than on the wet.

I am not at all satisfied with the colour of our *Lycastes*, the new growth is as good as we ever had, yet the flowers are neither as large or good in colour as before. It would be interesting to know if other growers have experienced the same during this season. I am afraid that this dull sunless summer and autumn has much to answer for, yet some Orchids seem really finer in colour, notably *Cattleya Bowringiana*. The temperature for each division will be safe with the figures given in last Calendar. *A. G. Catt, Parkfield, Hallow, Worcester.*

THE HARDY FRUIT GARDEN.

FRUIT TREES ON NORTH WALLS.—Morello Cherries and other fruit trees growing on northern aspects may now be safely pruned, winter dressed, and put in good order for the season. In pruning the Morello, reserve plenty of young fruiting wood, but avoid overcrowding of the shoots, as this not only prevents the ripening of the wood but weakens the trees, and the fruit, in consequence, is rarely fine. These trees also bear well on the spur system, but, owing to heavy cropping, soon become exhausted; but when trained like the Peach, they keep up a healthy growth for many years. Spur back to a couple of eyes all weak shoots not required for filling-up, and lay in at intervals young medium wood well ripened; the distance apart should range from 4 to 6 inches. See that all old shreds or ties pinching the bark be removed and replaced by fresh materials, and allow them plenty of room to swell. Young trees should, if not well-balanced, be taken entirely off the walls and regulated. In commencing to nail a fan-trained tree, the young beginner will do well to regulate and fasten all the main branches first; when once these are made to balance, then the young shoots may be filled in. Do not make use of too many nails, only sufficient to keep the branches in position. When drawing strong wood to the right place use either Willows or tar-twine, placing a piece of cloth to prevent the bark being injured. In the case of well-balanced trees, and where much nailing has to be done, there is no need for taking the whole of the trees from the walls each year, but examine the shreds and loosen them should there be any danger of the bark being pinched. Take care with the hammer, as a slight bruise not unfrequently leads to gumming.

The trees should be thoroughly washed to destroy insect pests, and if there is scale present brush it off and dress the trees with a solution of soft-soap and paraffin, keeping the two well mixed together when syringing. After the dressing and nailing is completed, should it be desirable to top-dress, remove from 9 to 12 inches of the top soil and bring to the surface some of the principal roots, first trimming the tips, and then relaying them in sweet loam and lime rubble, &c. A good dressing of lime carefully pricked in will be found very beneficial to most trees growing on northern borders, as for want of sunshine the soil is apt to become sour. Should the trees be infested with moss, dust thoroughly with fresh lime, and in a few weeks the moss will disappear.

NUTS.—Both the Filbert and Cob Nuts should be planted if the soil is of a medium loamy nature, and a good distance apart. These, with Apples, pay probably better than most fruits, as they may be stored for a length of time, and kept in good marketable condition. The Nuts should be planted at from 12 to 15 feet apart, and trained in cup-shape, which for the present is done by keeping the centres open, selecting from three to five shoots at equal distances to form the future heads; from these, as the bushes increase in size, more may be left so long as there is no crowding. Suckers should always be kept removed, and the stem clean 12 inches from

the ground-level to the bottom branches. Do not manure to cause strong growth; what is required is medium growth, and plenty of fruiting-wood.

FRUIT ROOM.—In wet weather the fruits should be gone over, and all faulty ones removed. Do not handle the good fruit more than possible, though a careful lift with the hand and the fruits again put down will do no harm; but this shifting should only be done to keep gaps good, and to keep the fruits together. Ventilate the room freely in mild weather, and to prolong the season of Pears some may be placed at the cooler end, always picking out the ripest fruit for present use. To hurry the ripening of Pears is somewhat difficult, and to attempt to retard them by placing them in a very cool spot will not do, as in both cases the fruits are never so good as when allowed to ripen gradually in a comfortable temperature.

VARIOUS.—Shred-cutting in wet weather should be pushed on so that there is plenty in readiness for fine days. Peg-making for Strawberries; fruit-boxes, &c., to be washed and put aside; net-making, stakes-pointing, and label-making are all jobs which should be forwarded in bad weather, and never left till the last minute. *H. Markham, Mereworth Castle, Maidstone.*

THE FLOWER GARDEN.

RECENT GALES.—The recent gales have caused the ground to be strewn with the branches of trees and leaves, consequently a general cleaning-up should be given in as speedy a manner as possible. Recently-planted trees and shrubs which have been loosened by the wind should, if not already done, be seen to forthwith, placing them upright, and making the soil firm about them. Plants of Wall-flowers and other spring-flowering subjects similarly affected should also be attended to in the manner indicated.

SELECT LIST OF TREES AND SHRUBS.—In forming new grounds and shrubbery borders, the following trees and shrubs should be planted among the common kinds, as well as singly on lawns and places where their characteristics will be seen to advantage; they are sufficiently hardy to be planted in all but the coldest parts of Britain:—*Acer japonicum* var. *aureum*, a most distinct variety; the leaves are many-lobed, usually seven to nine, but not infrequently eleven, which are of a soft pale yellow, with rose-coloured foot-stalks. *A. palmatum*, remarkable for the great variety in the form and colour of the leaves. *A. palmatum linearilobum* produces long narrow, slightly-toothed lobes, cut to very near the base; in the young state they, like the shoots, have a reddish tinge, but become grey as they grow older, the former retaining the reddish tinge in their foot-stalks and margins only. *A. palmatum linearilobum atropurpureum* is a very handsome and distinct sub-variety of the preceding, in which the leaves when first expanded are rose-purple, but which deepen with age to a bronzy-red hue. *A. palmatum septemlobum elegans* is remarkable for the changes of colour which its leaves undergo from first development to maturity, changing from a soft fulvous-green to rose, and subsequently to a deep red. *A. palmatum septemlobum elegans purpureum* is the most highly-coloured of all the varieties of *A. palmatum*; both young shoots and leaves when first developed are of a deep purplish-crimson, which ultimately become suffused with a greenish-black. *A. palmatum septemlobum laciniatum* is quite distinct from the preceding, and from the typical *septemlobum*; the leaves are of a soft pale green, with apex of the lobes tinted with rose when first developed—the lobes are linear, with the margins lacinate. *Cesalpinia japonica* is a beautiful Japan shrub, with leaves from 9 to 12 inches long; the inflorescence is a thyrid or sub-corymbose raceme as long as the leaves, and bearing from twenty to thirty bright canary-yellow flowers an inch in diameter, with which the red filaments and anthers form a striking contrast—the raceme remains fresh in water several days after being cut. *Clerodendron trichotomum* is a free-growing shrub, with erect stems and branches, forming in a few years a dense globose bush 8 to 10 feet high, and as much through; it is clothed with a bold dark green foliage, its large ovate-acuminate leaves being nearly 6 inches long. Its flowers appear in September, and are produced in large terminal cymes; they are white, with a purplish calyx, and deliciously fragrant. *Styrax japonica* is a deciduous shrub, of rather dense habit, from 8 to 12 feet in

height, furnished with a neat, deep green foliage, and bearing simple racemes of fragrant white flowers. *Cornus brachypoda* is a handsome deciduous tree, reaching to a height of 30 feet, and quite unlike any other *Cornus* in cultivation; the flowers are produced in cymes about as large as those of the common Elder, but of a purer white—they appear in June, and project well beyond the foliage of the tabulated branches. *Eucryphia pinnatifolia* is another remarkably handsome tree, growing from 8 to 10 feet high in its native country, Chili; it is furnished with a deep glossy green pinnate foliage, each leaf consisting of five ovate, toothed leaflets, about an inch long. The flowers, which are produced from the axils of the upper leaves, are from 2½ to 3 inches in diameter, each with four pure white spreading petals and numerous stamens, with long filaments, terminating in bright golden yellow anthers; they resemble in form an *Hypericum*, and are produced in July and August.

PLANTING BULBS IN GRASS.—During the last few days we have been planting bulbs of various kinds in masses in the grass in open spaces among the trees near walks. There are already well-established lines of Snowdrops on either side of the walks, as well as clumps among the trees, together with masses of Daffodils and Bluebells, so that with the addition of Hyacinths, Tulips, *Scilla sibirica*, and *Polyanthus Narcissus*, we expect to have a good show in the spring. To this display masses of Wall-flowers will add fragrance as well as variety. Bulb planting in the manner indicated (in holes about 7 inches deep), deserve to be more extensively practised than it is at present. The same remark applies to the planting of Lilies in open spaces, in bog and other beds. If planted in sunken pots filled with suitable soil, their roots will not be interfered with by those of trees and shrubs. *H. W. Ward, Longford Castle, Salisbury.*

THE APIARY.

STORING AWAY COMBS.—This should have early attention if not already done. Spare frames containing comb should be looked over, and those found to contain many drone cells are best put on one side to be melted down for wax. The remainder should be sorted, and those intended to be used for extracting purposes tied up in newspaper, labelled, and put in a dry place for fear of mildew; whilst those for use in the brood nest are best placed by themselves and treated in a similar fashion. If frames are too numerous to be tied up in this way, it is best to have a rack made in a dry room where they can be hung close together and covered over to protect them from dust. As a protection from the wax moth, a few pieces of naphthaline may be placed about them.

Sections that contain worked-out comb are very useful for the following year's work, as the bees are attracted to the crates, and take to them at once if a few drawn-out sections are placed in the centre. They, therefore, should be taken every care of, and prevented getting soiled by being packed carefully away in the crates and covered over. Should any of the comb in the sections be at all discoloured, the cells must be rubbed off down to the midrib, which can readily be done now that the wax is brittle.

SECURING HIVES AGAINST WIND, ETC.—The recent gales will have made havoc with hives in exposed places, where they were not made secure beforehand. A stake driven on each side of a hive is an easy means to prevent it being blown over; or if the roof only is likely to part company, this can be tied on with a piece of stout cord or galvanised wire. The legs of hives should stand well above the ground, preferably on pieces of brick, so as to keep them well out of the wet, and so prevent rotting. Hives should also stand level, as if they do not, they are apt to rock about, and be a constant source of disturbance to the inmates at a season when absolute quietude is essential. Hive roofs that leak and have gone too far to be puttied up should be covered with zinc, which will fit them for service for a long time to come. Hives with glass sides require to be very warmly wrapped up, as bees rarely survive the winter in them unless so treated.

PLANTING FOR BEES.—If evergreen shrubs can be placed to shelter the apiary from the north and east, if required, it will be found to be a great advantage in the spring, when so many bees come to an untimely end through exposure to the winds. *Expert.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, Nov. 24 } National Chrysanthemum Floral
Committee, at 2 P.M.
SATURDAY, Nov. 28—Royal Botanic, General meeting.

SHOW.

WEDNESDAY, Nov. 25—South Shields (two days).

SALES.

MONDAY, Nov. 23 } Dutch Bulbs, at Protheroe &
Morris' Rooms.
Dutch Bulbs at Stevens' Rooms.

TUESDAY, Nov. 24 } Great Sale of Lilies, Daffodils, and
other Bulbs, at Protheroe &
Morris' Rooms

WEDNESDAY, Nov. 25 } Greenhouse Plants, Palms, &c., at
Protheroe & Morris' Rooms.
Clearance Sale of Nursery Stock, at
Heathfield, Sussex, by Protheroe
& Morris (two days).
Dutch Bulbs at Stevens' Rooms.
Palms, Azaleas, &c., from Ghent,
at Stevens' Rooms.
Roses, at Stevens' Rooms.

THURSDAY, Nov. 26 } Dutch Bulbs, at Protheroe &
Morris' Rooms.

FRIDAY, Nov. 27 } Established and Imported Or-
chids, at Protheroe & Morris
Rooms.

SATURDAY, Nov. 28 } Dutch Bulbs, at Protheroe &
Morris' Rooms.
Liliums, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.5.

Electro-culture: or the cultivation of plants under the influence of electricity.

CENTURIES ago the commoner phenomena of electricity and magnetism had attracted some attention, but no one suspected that they meant anything in particular, or that they afforded indications of a

power everywhere present, and only waiting a summons to enter into the service of man. Yet we must not blame our ancestors for lack of attention or intelligence. The doors of knowledge have had to be opened one by one, and in early times, when so many of these doors still remained closed, and others were at best but slightly ajar, it is not a matter of wonder that the elusive laws of electricity should have remained unexplored. Even in our own century, what a long gap there was between the first production of the electric light and its application to practical purposes! It all seems very plain now, but two generations had to elapse before the electric light, as produced by Sir HUMPHREY DAVY in 1808, became available for general use.

If the progress made by electrical science was slow in its earlier stage, amends are truly being made now in the rapidity with which new views and new applications of it are crowding upon us. In electricity we have a power that has been in the world from the beginning, but from which, down to the present century, not one single valuable result was drawn, for the simple reason that our predecessors did not know how to make use of it; did not know enough even to recognise it in some of its manifestations. To-day, mankind has no more obedient, or, it may be added, capable servant.

The early students of electricity had a task that closely resembled putting together a complicated puzzle, of which there was no plan; but as piece was joined to piece, the plan began to reveal itself, and subsequent progress was rapid. And if, in this year of grace, 1891, the puzzle is not complete, at least we have, as far as it goes, a fairly symmetrical and intelligible pattern before our eyes, a circumstance which enables us to develop any new suggestion much more rapidly than before.

The title electro-culture is one of those new words which the progress of science is continually adding to our language—it refers to the cultivation of plants under the influence of electricity. To many this will appear as an entirely new idea, but the notion of helping forward the growth of plants by the aid of electricity is not actually new. Experiments appear to have been made by MAMBRAY in this direction as early as 1746; and the notion has probably been simmering in the minds of some scientists ever since. It is only within recent years, however, and since we have learned more about the management of this wonderful power, that any serious researches have been undertaken, and the word *electro-culture* is, as it were, but a word of yesterday's coinage.

There are two ways in which the influence of electricity upon plant-life may be studied:—

1. The effects of the rays of electric light upon vegetation may be investigated.
2. The influence of electric currents upon growing plants may be examined.

Let us first inquire into the history of electro-culture, and notice the experiments which have been made from MAMBRAY'S empirical researches down to those of the present day.

Little is known of MAMBRAY'S work beyond the fact that he carried on a number of experiments; and when we remember the loose habit of thought which characterised the "scientists" of the eighteenth century, we may feel certain that there is little use in speculating upon them.

In 1806, we learn that DE CANDOLLE gave a great deal of time to the examination of the behaviour of plants under the action of electricity, but with little result for the science of electricity was then but little advanced. Later, HERVÉ-MANGON and PRILLIEX worked upon this curious subject of research, and with no better results.

Some really interesting experiments were, however, carried on some time ago by GRANDEAU and NAUDIN. GRANDEAU tried to prove that electricity was a vital necessity to the growth of vegetation, and that this electricity naturally existed in the soil. Now, there are some substances which, like glass, porcelain, &c., prevent the movement of electricity; these are called insulators, and a body is said to be insulated when it is so mounted on or surrounded by one of these substances that no electricity can get to it. Again, electricity can act at a distance, but if a body is placed in a metallic cap, and then mounted upon an insulator, no electricity can get to it or act upon it.

GRANDEAU took advantage of these facts, and one of his experiments was as follows:—Several Tobacco and Maize plants were placed in an insulated position, and surrounded with a continuous metallic cap. After being carefully grown under these conditions for several months, it was observed that the plants had become unhealthy, whilst similar plants grown under normal conditions, being neither insulated nor capped in, developed perfectly.

It must be admitted that a critical observer, who possessed a good knowledge of the laws of electricity, could not be expected to attach much importance to this experiment.

NAUDIN performed a less negative experiment. He planted Beans, Lettuces, Tomatos, &c., and surrounded each plant with an iron wire cap, and connected this cap by means of conductors to a source from which electricity could be freely supplied. The results obtained by this treatment were somewhat significant, and, as similar plants were cultivated in the ordinary way, NAUDIN was able to draw comparisons.

The Lettuces under the cap obtained an average height of 1.20 mètres (a mètre is equal to about 39 inches), and a weight of 427 grammes (a gramme equals about 15½ grains), as against a height of 1.0 mètre, and a weight of 337 grammes when grown without the aid of electricity.

The Tomatos grew to an average height of 1 mètre, and a weight of 3.754 kilogrammes (a kilogramme is about 2½ lb.), whereas, when grown in the ordinary way, the height was 80 centimetres (a centimetre equals about $\frac{1}{10}$ inch), and the weight 3.627 kilogrammes.

No data are available with regard to the Bean-plants, but it is stated that they grew to a large size, and looked more healthy than those which had not been treated with electricity.

In England, the late Sir W. SIEMENS made some very remarkable and much more searching experiments, especially regarding the influence of electric light upon plant life. One of his investigations lasted several months. The plants were grown in two small greenhouses. Two lamps were employed of about 5000 candle-power; one of these was placed inside one of the greenhouses, whilst the second was suspended at a height of about 4½ yards above the other. The temperature of each house was maintained as uniform as possible at about 15° Centigrade.

Several kinds of seeds were sown, and plants set in, and the results were observed to be, on the whole, unfavourable, especially in the case where the greenhouse was illuminated from the interior.

Sir W. SIEMENS then thought of softening the intensity of the electric light by covering it with variously tinted glasses. By this means he was enabled to demonstrate that vegetation proceeded rapidly when white glass was used; that it was much slower under yellow glass, and that in this case the plants were less vigorous and paler in colour; that red glass produced a medium growth, whilst the foliage was meagre and yellowish; finally, that blue glass yielded the worst results of all.

Where white glass was used, Raspberries planted on December 16 bore fruit on March 1. Strawberries planted on December 10 furnished ripe fruit on February 14. Vines planted on December 26 gave excellent Grapes, fully ripe, on March 10. With cereals there was equally rapid growth: Peas germinated in two days. The examples exhibited before the Royal Horticultural Society, at various times, by Sir W. SIEMENS, were little short of marvellous, as regards rapidity of growth. The general results are given in the *Gardeners' Chronicle*, by Sir WILLIAM SIEMENS, and others, in our volume for 1880, March 20, March 27, and April 3, together with illustrations showing the manner in which the light was applied.

It appears, then, that the effect of the electric light upon plants is of a very powerful order, and such experiments open up an exceedingly interesting line of research, which might lead to really practical results, of which we shall have more to say on another occasion.

CATTLEYA LABIATA WITH TWO LIPS.—Mr. LUCIEN LINDEN has been good enough to forward us a flower of the true autumn-flowering labiata with two lips. These two arise apparently from the subdivision or branching of one, and not as sometimes happens from the unusual development of a stamen in the form of a petal. We may add also, *à propos* of recent discussions, that whilst one lip had the character of *C. labiata autumnalis*, the other had the features of *C. Warocqueana*.

VIEWS IN THE GARDENS AT ALDENHAM.

POTATO DISEASE AND THE BORDEAUX MIXTURE.—The report made to the chief of the division of Vegetable Pathology in the United States Department of Agriculture, shows that the cost of treatment made with a small handforce pump, and in the most thorough manner, was more than compensated for by the increased yield secured.

A SYRIAN TRUFFLE.—In a recent number of the *Comptes Rendus*, M. A. CHATIN describes a peculiar Truffle, under the name of *Terfesia*. The species is known to the Arabs under the name of *Kammé*, and is brought to Damascus by a tribe of Arabs who are clothed in skins of the gazelle. Some idea of the quantities collected may be gained by the record that during the season ten camel-loads are daily brought to Damascus.

PLANT DISEASES.—The *Journal of Mycology*, published under the auspices of the United States Department of Agriculture, is devoted especially to the study of fungi in their relation to plant diseases. It furnishes an excellent example of the go-ahead-ness of our cousins on the other side of the Atlantic, and one which we should be glad to see followed here. Indeed, it is much to be desired that a Society be instituted in this country for the investigation of plant diseases, and the publication of results. The County Councils, moreover, might very well combine to secure the services of competent fungologists and entomologists, and to pay them sufficiently well to induce them to devote their time and their talents to research and experiment. Such a scheme, together with the institution of a pathological Society, would greatly advance matters.

"DIE NATURLICHEN PFLANZEN FAMILIEN."—This work, several volumes of which are in process of issue concurrently, appears with its usual regularity. Owing to the manner of publication, the sorting of the sheets for the binder becomes a matter of difficulty; indeed, it will be found preferable, we think, in order to avoid mistakes, to keep the several Lieferungen, Theilen, Abtheilungen, and Bogen unbound till the whole is complete. What LINDLEY did single-handed, or with scant assistance, in his Vegetable Kingdom is here worked up by several monographers, who incorporate a summary of the most recent researches in histology with those relating to the morphology and affinities of the several orders. In the last part we find that our humble *Adoxa* is advanced to the dignity of having a separate order all to itself, so that *Adoxaceae* now constitutes an order of a single genus and that of a single species!

JUBÆA SPECTABILIS.—"W. O.," Fota, writes in the *Garden*, that this noble Palm survived the winter at Cork, with little or no protection, even though 14° of frost were registered. The writer considers it as the most hardy Palm next to *Chromerops excelsa*.

LINNEAN SOCIETY.—At the meeting on November 5, Professor STEWART, President, in the chair, Mr. W. L. BROWN was elected, and Professor W. F. WELDON was admitted a Fellow of the Society. On behalf of a number of subscribers, Mr. CARUTHERS presented to the Society a half-length portrait in oils of Sir JOHN LUBBOCK, Bart., M.P., P.C., and F.R.S., a former President, painted by Mr. LESLIE WARD; and the remarks which he made on the services rendered to biological science by Sir JOHN LUBBOCK drew from the latter a graceful acknowledgment of the honour conferred upon him. Amongst the exhibitions which followed, Mr. E. M. HOLMES showed some new marine Algae, from the Ayrshire coast; Mr. J. G. GRENFELL showed some Diatoms with pseudopodia, illustrating his remarks with diagrams, upon which an interesting discussion followed. The President exhibited, and made some observations on, a tooth of the walrus, which illustrated in a curious manner the periods of growth. Mr. R. V. SHERRING called attention to a large series of framed photographs which had been taken under his direction in Grenada, and illustrated the general character of the West Indian Flora, as well as the

physical features of that particular island. Mr. J. E. HARTING exhibited a specimen of Wilson's petrel, which had been picked up in an exhausted state in the county Down on Oct. 2 last, and had been forwarded for inspection by M. R. PATTERSON, of Belfast. Mr. HARTING gave some account of the species, and remarked upon the unusual number of petrels, shearwaters, skuas, and other marine birds, which had been driven inland to a considerable distance during the recent gales. A paper was then read by the Rev. Professor HENSLOW, M.A., entitled "A Theory of Heredity based on Forces instead of any Special Form of Matter" (see p. 613).

VARNISH TREES AT FRANKFURT.—When, in 1875, Professor Rein returned from his travels in the Orient, and two years of whose time had been utilised in journeyings in Japan, he brought home seeds of the best of the cultivated Japanese species of varnish-furnishing trees, which he presented to the botanical gardens at Frankfurt-on-the-Maine for cultivation, says the *Illustrierte Garten Zeitung*. The seeds were sown in the open air, and about forty plants grew. The soil in which they were sown and reared was rich and moist. The plants flowered with great freedom, and set seeds, which ripened completely. The German government at the end of August this year deputed Professor Rein, who was at Bonn, to go to Frankfurt to put into practice the methods he had learnt in Japan of extracting the juices of the plant, and manufacturing lacquer. These experiments brought satisfactory results. In Japan the lacquer harvest is begun in July, and the Professor believes that equally good trees can be obtained here as there. The question is, is the lacquer as good as that obtained in Japan, and the point is to be settled by scientific investigation. Experiments have proved, that on cool days the flow of sap was very small, whilst on warm ones the flow was abundant. The trees which have been tapped can, after a short interval, be again operated on.

STOCK-TAKING: OCTOBER.—Once again the record is against us in the matter of imports, but the "difference" shows a diminishing quantity—£872,407. The figures for the ten months show an increase of £4,251,836. For those who have the time it would be an interesting exercise to see how much of the reduction is due to lower prices. The same remark applies to the matter of exports; of this, more anon. The following is our usual excerpt from summary of *Imports of Foreign and Colonial Produce for October, 1891*:—

	1890.	1891.	Difference.
	£.	£.	£.
Total value for month	£17,746,236	£16,873,829	-872,407
§II.—(A.) Articles of food and drink—duty free ...	12,440,183	12,929,033	+488,850
(B.)—do., dutiable	3,165,302	3,323,452	+218,150
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	6,997,451	5,423,318	-1,574,133
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,105,988	4,038,042	-67,946
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,331,166	1,301,447	-29,719
(B.)—Parcel Post ...	58,438	59,152	+714

In the exports of British and Irish manufactures, there is recorded a decrease of £2,506,977 as compared with the same period last year, and of £12,491,168 for the ten months as compared with 1890. It must here be borne in mind that there is not this year a M'KINLEY "boom"—things are all the other way; and we cannot record a perfect recovery in the money market from the effects of the BARRING scare. Affairs in Chili and Brazil

have had a damaging effect on our commerce; so much was expected from those localities after the M'KINLEY Tariff Act had begun its operations. Altogether the wonder is—not, perhaps, so much that the exports have been reduced by the figures noted, but that the falling off has not been more. Common sense is coming to the help of those peoples equally interested with ourselves in the spread of Free Trade principles, and these are not the millionaires of protected countries. The "set" to be made in the United States against the M'KINLEY Tariff will be a very determined one in the imminent Presidential election campaign; and the demoralising effect of Protection in the encouragement of smuggling, &c., is being felt on the enormous "borderline" of the United States. It is worthy of note that "indirect" smuggling is largely on the increase in the States, for all travellers of that ilk on their return home are simply loaded with articles of personal attire, which pay nothing to the Customs; and an association has been formed in New York whose object is to watch all such "operations," and draw the attention of the Government and its officials to this, as it is termed, "unpatriotic" conduct. In France, the discovery has been made that protecting the silk industry is all against the trade, for by just so much as that of France has decreased—and the figure is considerable—so great has been the gain in Italy—a double discovery, of equal value to the parties interested. The Ministers of Commerce in both countries have made the discovery, but not until the artisans had had tangible experience of the grave blunder. We must wait returning confidence at home and peace abroad, improving the processes of manufacture wherever possible, ready for a fresh start at, let us hope, a not distant date. The following figures are extracted from the general mass of imports for the month, and possess all the old attractiveness:—

	1890.	1891.	Difference
§ II. Fruit:—			
Apples, raw ... bush.	586,832	593,402	+6,570
Unenumerated, raw	686,262	706,685	+20,423
Onions	514,681	474,881	-39,800
Potatoes cwt.	55,938	44,135	-11,803
Vegetables, raw, unenumerated value	£60,191	66,805	+6,614

It may not be inopportune here to record that the Council of the Central and Associated Chambers of Agriculture have been taking stock of the Railway Tariff which is to come into operation in August of next year, and have found that the railway companies will not be altogether losers by the new state of things. The grower near London will be in no better position than he is to-day, owing to the terminal charges and the diminishing scale for those further afield. This is certainly hard upon those who pay such rents and rates as those within comparatively short distances of the metropolis. Messrs. HICKS-BEACH and CHAPLIN will doubtless have their attention drawn to this at the earliest possible date, but however willing these gentlemen may be to help the tiller of the soil in this dilemma, we doubt if anything can be done to mend matters until the new Parliament meets.

CHICHESTER MUNICIPAL ELECTION.—It may interest many of our readers to know that at the recent municipal contest at Chichester, Mr. H. H. MOORE, of the Chichester nurseries, was returned at the head of the poll by a majority of twenty.

THE CHICAGO EXHIBITION.—California is the first State to respond to Chief BUCHANAN's request that each State contribute the trunks of three of its most characteristic trees, to be used in constructing a rustic colonnade for the Forestry building. California's contribution includes a Sugar-pine, *Pinus Lambertiana*, furnished by TOWLE BROS.; a Redwood, *Sequoia sempervirens*, by J. F. CUNNINGHAM; and a Sequoia (*Wellingtonia*), by SMITH COMSTOCK. One acre of ground within the horticultural building has been reserved for an Orange grove from Florida, and the same amount for a grove from California.

These trees will be brought to Chicago next year, and planted so that they will bear fruit while the Exposition is open. These two acres constitute two interior courts of the building.

NEWCASTLE-ON-TYNE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The third ordinary meeting of this Society was held at the Literary and Philosophical Institute, Newcastle, on Thursday, November 5. Mr. A. HESLOP presided. Mr. ADAMSON introduced the questions which had been asked by various members of the questions committee, and which included *Eucharis candida*, Tomato disease, herbaceous plants, &c. A slight discussion took place in answer to each question. Seventeen new members were proposed and elected. On November 19, a paper was read by Mr. JOHN ELLIOTT on "Plant Construction."

A £250 CYPRIPEDIUM.—In the Orchid-houses at Messrs. F. SANDER & Co.'s may be seen a plant in flower of the *Cypripedium insigne* Sanderae, which was so much admired when it was exhibited at the last meeting of the Royal Horticultural Society. It was introduced by Mr. SANDER three years ago as a single plant. Half the plant was acquired by Baron SCHRODER at auction for 70 guineas, the other half going to Mr. R. H. MEASURES, who divided his portion into four, one being secured by Mr. R. I. MEASURES, one passing into the hands of F. L. AMES, Esq. The remaining two parts were retained by their owner, who sold one to Mr. SANDER on Saturday last for £250.

COUNTY COUNCILS AND THE EDUCATION SCHEME.—In a circular addressed to teachers in public elementary schools, the Technical Education Committee of the Surrey County Council state that arrangements have been made for the following lectures and classes on Saturdays, at 11 A.M., beginning on October 3:—

GUILDFORD.—Agricultural Chemistry, followed by Laboratory Work. In the afternoon a class in Qualitative Analysis.

FARNHAM.—Experimental Mechanics, followed by Laboratory Work.

REDBILL.—Culture of Fruit and Vegetables, followed by a class. (Illustrations by diagrams.) Probable class in Qualitative Analysis.

CROYDON (or the neighbourhood).—Experimental Mechanics, followed by Laboratory Work.

KINGSTON.—Chemistry of Arts and Industries, followed by Laboratory Work, with class in Qualitative Analysis.

CHERTSEY.—Agricultural Botany, followed by a class; or Animal Physiology, followed by Laboratory Work.

After Christmas, the subjects in the various centres are to be changed. In reference to this matter, a correspondent writes as follows:—"You will see by the enclosed cutting that the Committee of the Surrey County Council has arranged for six courses of lectures in as many different towns for teachers in public schools, five out of which six courses are of great importance to all gardeners, but everyone except the teachers is effectually stopped from attending, the lectures starting at 11 o'clock on Saturday morning. Why could they not be fixed for some time in the evening? thus enabling persons engaged during the day to attend, especially as the public can do so for a fee of 2s. per lecture; and it would be no more trouble to address a full room than it is to address one half-full. The hour is fixed, I suppose, to suit the teachers (which I doubt if it does); but surely they would not object to have them on another week-day evening, and thus get Saturday clear. This alteration would be a boon to thousands of farmers and gardeners, instead of which, as at present arranged, it is a great means of good only half used."

CATLEYA LABIATA.—Now that attention is called to the plants of autumn-flowering labiata of the old stock, there seems to have been many more

varieties than was anticipated, and some of them of but indifferent quality. The best we have seen is represented by a superbly rich-coloured flower from Sunny Hill, Llandudno, taken from a plant which the owner, JOSEPH BROOME, Esq., says has been in his possession for more than a dozen years. The flower is $7\frac{1}{2}$ inches across, with petals $2\frac{1}{2}$ inches wide. The sepals and petals are bright rosy-lilac, and the lip has but little yellow at the base, and with a dark velvety crimson front lobe. There is a white ray from the column up the base of each segment, and the flower looks particularly bright at night by artificial light—a quality which is shared by all of the recent importations, which have flowered, and which seems to assist greatly in establishing their identity.

MANCHESTER ROYAL BOTANIC GARDENS.—The following dates are fixed for exhibitions during the forthcoming year:—First Spring Show in the Town Hall, Manchester, March 15, 16; second do., April 26; Special Exhibition of Orchids, Roses and Rhododendrons, opens at the Gardens, June 3; Orchid Conference, June 4; Rose Show, at Gardens, July 16.

SANDRINGHAM.—In connection with the extensive alterations which have been carried on since Mr. MCKELLAR took charge, there has been just completed a fine and commodious bothy for the young men, fitted up with all the latest improvements in heating and sanitation, hot and cold water, lavatories, baths, &c.; and to inaugurate the new premises, the gardeners on Thursday evening last gave an evening entertainment, which was much appreciated.

THE DESTRUCTION OF BLIGHT ON PLUM TREES.—In order to destroy blight and insect pests generally on Plum trees, the foliage may, it is said, be advantageously sprayed with a liquid composed of the following ingredients: black soap, 35 grammes; warm water, 1 litre; amyl alcohol, 60 grammes. The soap is dissolved in the water first, the solution cooled, and then the amyl alcohol added. Care should be taken to reach both surfaces of the leaves with the spray, and the operation should be performed either in the early morning or in the evening. The treatment is only necessary about twice.

THE LIBRARY AT KEW.—The December number of the *Bookworm* will contain an article on the Library at the Royal Gardens, Kew.

OAKDENE, GUILDFORD.—This estate has been purchased by the Marquis of SIBBO. Mr. H. AUGER remains in charge as Head Gardener.

HEN AND CHICKENS CHRYSANTHEMUM.—Messrs. CANNELL send us specimens in which the terminal flower-head was surrounded by a cluster of side-buds, just as in the Hen and Chickens Daisy, but more crowded. The bond between mother and children, however, was not very strong, as they all fell away one from the other.

NOVELTIES.

DALGARNO'S PATENT TURF CUTTER (fig. 89). This machine has been designed in order to furnish an implement for cutting turf, to supersede the edging-iron and spade. Where large breadths of turf require to be cut for bowling and tennis-greens, it has hitherto been a tedious process, and it is also difficult to cut the turves all an equal depth, as also to cut them perfectly square. The cutting part of this machine is a round steel disc, with a socket for inserting into the handle; this disc is made to shift by a screw, to cut any depth from 1 to 3 inches. The guiding wheels are attached to the casting at a convenient distance on either side of the disc, and when it is cutting, these wheels keep the disc in proper cutting position. The main casting is so constructed as to give the required weight needed for making the disc cut the grass freely. In cutting the turf, a line is laid down from end to end, the disc inserted on the line, and the machine moves

along quite freely. The sides of the turf are cut perfectly square, and at an equal depth, which ensures perfect accuracy when a tennis-green has to be turfed. Mr. Barron, of Chiswick, and others, have seen it at work, and speak highly of its simplicity and efficiency. The machine can be worked easily at an ordinary walking pace. The patentee is Mr. Dalgarno, gardener, Gilcomston, Aberdeen.

HOME CORRESPONDENCE.

A FINE CROP OF ONIONS.—This year it seems that the spring-sown Onions in this locality have proved almost a failure. In the first place the maggot spoiled a quantity, and what survived the mildew seemed to have been completely demolished. I have seen the remains of what at one time promised to be a very fine crop; but the maggot and mildew has made a fearful havoc amongst them. I have grown six of what may be called the best sorts, viz., Bedfordshire Champion, which is considered a heavy cropper; James' Long-keeping, an excellent keeper; Rousham Park Hero, Nuneham Park, Veitch's Maincrop, and Dickson's Defiance; the last-named is the best. From the first it took the lead, and those who have not grown it will do well to give it a trial. All the above kinds were grown on the same piece of land, and given similar treatment. The ground was dug last autumn, and left rough; at the end of February it was forked over, working in lime and soot mixed together. Dickson's Defiance Onion is of fine shape, and available for the exhibition-table. It is also one of the best for general use, it being firm, heavy, and an excellent keeper. C. E. Martin, *The Hoo Gardens, Welwyn.*

THE PROPOSED INTERNATIONAL FRUIT SHOW.—There can be no doubt whatever but that the proposed international fruit show, referred to in your leader of November 7, has already attracted great attention. It is a fact, good or bad, that fruit culture, and all that relates to it, is just now a dominating idea in the public mind; and, so far as I can learn, the chief object of the proposed show is to help to turn that sentiment to practical account. I was not present at the impromptu meeting held at the Crystal Palace in the afternoon of the day of the October fruit show held there, but I am informed that the original suggestion, that such an international show should be held, and at the Palace, was a spontaneous one, and in reality grew out of the recent International Fruit Show at Edinburgh, which some of those present at this informal meeting attended, and who were desirous of seeing something of the kind promoted in London. Amongst those interested in fruit culture with whom I associate, I never hear, publicly or privately, one word derogatory to the Horticultural Society on its premier position as a horticultural society, but simply objections which seem to be used as to the business capacity of the Council in relation to the conduct of large national or international enterprises. It cannot be too clearly shown, that the mere fact that a gentleman is made a member of the Council does not evidence that as a consequence he is therefore a first-class business man, and it is specially evident that good business qualifications, with plenty of shrewd clear-headedness and independence of thought, as well as decisiveness of action, are the chief elements desired when the conduct of a great effort such as this proposed exhibition is in question. I venture to think that the Council could hardly send as representative, if it purposes to do so, on to the proposed committee better men than Mr. W. Marshall and Mr. G. Bunyard; but all the same I would point out, so far as the latter gentleman is concerned, that as I gather the wishes of the original promoters, it is hoped that the nursery trade will be only very sparingly represented, because it is so earnestly desired that the exhibition should not be concerned or conducted in the interests of any section or class; but be as much in the interests of consumers as of growers, and of private gardeners, amateurs, cottagers, &c., as of the fruit tree trade. In the ultimate formation of the Executive, it will be impossible to overlook these various interests, hence there can hardly be found stronger reasons for keeping the entire control of the exhibition in the hands of a body which represents no special interest, but the interests of fruit universally. Of course, there are many "ifs" to be encountered before the proposal can be realised, but I do know, that

whilst Providence may shape our ends, rough-hew them how we will, yet it is the possession of plenty of moral force, courage, and capacity to perform the rough-hewing, which becomes the assured creator of ultimate success. For this reason opinion is, I believe, unanimous in favour of the leadership of Sir James Whitehead. The proposition needs powerful influence and a strong financial backing. But more than that, Sir James Whitehead has literally taken the lead in fruit culture, quite apart from the Fruiterers' Company, because he is endowed with strong enthusiasm in its favour. I incline to the belief that every agricultural, as well as horticultural, body in the kingdom ought to be anxious to give the proposed exhibition every possible encouragement and support. It is to be a great national effort, and any bodies which hold aloof will suffer in prestige, and lose a splendid opportunity to render horticulture, so far as relates to fruit culture, great and good service. Let the council of the Royal Horticultural Society learn to realise that some may be of its most earnest supporters, and yet as anxious to help every good movement of an horticultural nature, and then it will take no unwise course, but will, heart and soul, associate itself with the proposed exhibition. *Fructus.*

its usefulness as a pot plant for room decoration, as it will last in bloom quite six weeks in the drawing-room. The plant is of easy culture, and may be said to be capable of growing anywhere. In very wet soils, a little protection should be afforded it by covering the soil around the plant with charred garden refuse. *G. B. Claydon.*

CIDER KEEPING (see also p. 620).—If your correspondent, "A. W.," Hereford, p. 591, will get 4 or 6 lb. of common treacle and 1 lb. of ground ginger, mix well together, put it into a tin pan, and bake it well until quite hard; then break it up and put into his cider, let it stand perfectly bunged-up for three months, he will find on tapping that his cider will be perfect, and fresh as champagne. I have known cider keep beautifully for several years on this treatment. I have never known Hops used. This is an old recipe of sixty years ago. *T. H. R.*

ABUTILON THOMPSONI.—This is one of the best yellow foliage plants at command for employment in the flower garden. The large blotches of marbled yellow on the deep green leaves are very effective when judiciously employed in beds with suitable companions. We plant this Abutilon among

nepalense. The dissections in the original drawing (six separate perianth-segments, a single stamen, pistil complete and horizontal, and vertical section of ovary), are not reproduced in the published plate. The figure in *Elvans* is copied from the published figure of Wallich, both as regards form and colouring. The three figures are in reality one only, and that one drawn and coloured from a dried specimen of *L. nepalense*, Dön. No one, who has seen the three figures, could possibly suppose that they had any thing to do with the Burmese *L. Wallichianum* superbum. Leaving flowers out of account, in the Nepal plant the leaves are short and oblong-lanceolate, in the Burmese plant they are long and narrowly linear. *J. G. Baker, Ken.*

BOUVARDIAS—Very few flowers are so useful as these at this time of the year, and onwards to next March. One of the prettiest shows of Bouvardias I have ever seen, came under my notice this week. There were plants in all sizes of pots from 48's up to 16's, and ranging from 9 inches up to 4 or 5 feet in height. Many of them were quite covered with flowers, particularly Mrs. Green, Vreelandii, and Hogarthi flore-pleno. They were not grown in any particular compost; some had a nice mixture of turfy loam and sand, others; leaf-soil and ordinary garden loam, and a few were grown in garden loam and well-decayed stable-manure from an old hot-bed. All of them, however, were looking remarkably healthy, and there was little to choose between them, whether grown in one composition or the other. I discovered that the main reason of such a grand success lay in having the plants thoroughly well drained, and giving them plenty of water. Struck in the spring, and grown on rapidly in a temperature of 65° to 70° until the middle of July, afterwards kept in a cool-house and well syringed upon bright days, constituted, according to my informant, all the attention they received. By the end of September the plants had a little fire heat, and were very soon in active growth and flower. By feeding the plants and giving them a temperature of not less than 55° at night, rising to 65° and 70° upon a bright day, these plants will continue to supply an immense amount of flowers for another two or three months to come. Bouvardias like a good supply of water, but the plants must not be allowed to get sodden at the roots or dire results are certain to accrue. *A. P.*

CLIMBING NIPHETOS ROSE.—Referring to your notice (p. 586) of the disappointment one of your German correspondents has received regarding the above, I must say a word in favour of this Rose. Your correspondent, and also the nurseryman he mentions, have evidently not got hold of the proper variety. You mention that it may be that the climbing habit is not assumed at first. Now quite the contrary is the fact, for from the very first growth this grand variety grows very vigorously. I have young plants that were grafted during last February and March, and that are now carrying two to four long shoots, some of them fully 12 to 15 feet long. This is the first time I have heard any complaint respecting this Rose. Climbing Niphetos has with me proved itself all that Messrs. Keynes, Williams & Co. claimed for it on introducing it to the public. Its flowers are in all respects equal to the well-known kind that it originated from. If your correspondent would purchase from a sound firm, or from the raiser, I do not for a moment think he will be disappointed as regards its climbing characteristics. *A. Piper, Uckfield.*

— An article or paragraph referring to this Rose (p. 586) would probably excite some suspicion as to the climbing capabilities of this Rose. I have one here that is upwards of 14 feet, and that has borne probably over 700 flowers since last Christmas. I have frequently been asked if that is the climbing Niphetos, but I am under the impression it is not, because it was planted before the so-called climber came into repute. It does climb certainly, and that very well; and may easily be called under that head. I have not yet seen a good plant of the climbing Niphetos, neither do I want it, as the variety we have climbs as far as we need it to, and is the most useful Rose that we have, for I need hardly say that we are seldom without a bloom of it. *W. A. Cook, Compton Bassett.*

BEGONIA WELTONIENSIS.—This is one of the best of the fibrous-rooted Begonias for flowering in the greenhouse continuously for five and six months at a stretch, provided, of course, it receives reasonable treatment. The bright salmon-pink of the

FIG. 85.—PATENT TURF CUTTER. (SEE P. 618.)

FORCED SPINACH BEET.—Most gardeners know the value of this kind of vegetable, and often substitute it for true Spinach, especially if the summer has been a dry one. Spinach Beet may be forced by filling a garden-frame, standing on a mild hotbed. This may be done in the late autumn, and there will be no lack of young leaves to use as Spinach during the first three months of the year, a time when but little true Spinach can be found in the garden. *G. B. Claydon.*

BOCCONIA CORDATA.—All who are in search of stately free-growing perennial plants, and not already in possession of *Bocconia cordata*, should hasten to secure it. It is not only suitable for back rows in roomy herbaceous or mixed borders, but also makes a suitable display as a single specimen lawn plant. Its bold and pleasing contour is made up of numerous large, irregular-edged, heart-shape leaves of glaucous hue, over which rise bold panicles of light-brown flowers, with chaste elegance. Therefore, as a Chinese plant, it has distinctive features, whilst its hardiness, and the very moderate price it is catalogued at, leaves nothing to be desired, though it may be well to remark it thrives best in deep sandy loam upon warm aspects, and is not at all partial to cold undrained soils. *William Earley.*

SEDUM SPECTABILE.—This is one of the prettiest of our autumn-flowering plants, with its glaucous foliage; but its greatest merit is, in my opinion, in

tuberous-rooted Begonias, mainly red varieties, keeping them about a yard apart, and restrict them to a single stem. The deep green of the Begonia foliage, and the bright red of the blossoms, make a capital contrast with the yellow blotches of this Abutilon, especially when the plants stand above the Begonias a couple of feet. Cuttings inserted in a brisk bottom heat in March grow into nice plants by the beginning of June. The plants should be restricted to a single stem, allowing that to grow uninterruptedly, in this way the finest leaves are developed. If larger plants are required, cuttings should be inserted, three or four together, in 3-inch pots early in September, plunging them in a gentle hotbed until roots are formed, when the plants ought to be kept stocky by placing them near to the glass in a cool-house through the winter, potting them off separately early in March. *E. M.*

LILIUM OCHROLEUCUM, Wallich.—I am much obliged to "J. M." for the reference to Lindley's note on *L. nepalense*, in *Gardeners' Chronicle*, 1855, p. 564. Judging from the short description, I should think the plant he had before him is more likely to have been polyphyllum than nepalense. In answer to "J. M.'s" question about Wallich's ochroleucum, the following is how the matter stands:—The drawing which we have in the Kew collection marked *Lilium ochroleucum* in the handwriting of Wallich, is manifestly the original of his plate published in *Planta Asiaticae Rarioris*, under the name of

reely-produced blossoms is very pleasing on the plant, and in a cut state it is serviceable, when in good lengths and associated with its own foliage, set up lightly, adding only a few fronds of Maidenhair Fern to make the appearance lighter still. Dividing the roots is a ready means of increasing the stock. *E. M.*

YUCCA FILAMENTOSA.—If planted in masses on a lawn, *Yucca filamentosa* is very attractive when in flower during August, the almost white flowers contrast so well with the surrounding green of the turf. Any ordinary good soil will grow this *Yucca* to perfection, provided some manure is added at planting-time, which not only increases the size of the flowers, but gives a deeper colour to the leaves, which enhances the appearance of the plants at all times. *S.*

ESTATE FRUIT PLANTING—At p. 557 "A. D." appears sceptical upon some of the points raised, especially as to whether we are pursuing the best tactics in the matter of stocks. I suspect he has formed his opinion from the condensed reports only, and not from the entire substance of the paper. At all events, his theory and doubts as to "whether there could be found outside of nurseries, just the technical knowledge, born of wide experience, which nurseries alone afford," is extremely fallacious, and his fears as to the inferred supplying of "badly worked or inferior trees" to tenants is equally absurd. The purchasing of maiden trees from the trade would not remedy this, and the least experience would soon convince "A. D." how erroneous it was to remove maiden trees that were intended to make standards for orchards, although the plan may do for bush work or pyramids. We do not want to dwarf the Crab stock, nor yet to lose any of its vigour; but we do want to substitute for its natural and barren tap-roots a multiplicity of fibrous and fruitful roots, for which purpose we always select the strongest and healthiest seedlings. Moreover, we hold that the extra trouble taken in the preparation of the stock, prior to working, is amply repaid in after years, especially when the question of root-pruning, and its doubtful consequences by inexperienced persons, are considered. Home plantations have been made of all the best varieties, demonstrating the best known methods of cultivation, in order to teach an object lesson to such tenants as are open to receive sound practical ideas on fruit growing. There may be other advantages, on large estates, without casting any reflection upon the trade, but I ask, what scheme can be more likely to succeed as a permanency, or more worthy of encouragement, than the enterprise of supplying tenants gratis, farm and cottage alike, with first-class trees of first-class kinds, well proven to suit the locality? We are so sanguine of the results, gained by past experience, that we shall continue to extend it, thereby adding to the commercial value of the property. If such were universally carried out, we should certainly bear less about the deferred planting, owing to the insecurity of tenure, &c. The scheme adopted here, first suggested itself from the fact that, both cottages and farm tenants, during the long years of agricultural depression, who were best suited with fruit trees on their holdings, were in a better position to meet their rent obligations, than their brethren less fortunately placed with fruit trees. If "A. D." is still sceptical, I hope he will arrange to pay us a visit now at once, before the trees are sent out for distribution, in which case I promise hospitality and welcome, and I will further undertake to demonstrate more fully the practice I have hitherto conscientiously preached, endeavouring to convince him that the quality of both trees and stocks are inferior to none, although worked by a handy labourer, without the supposed inevitable "long nursery experience." *Wm. Crump, Madresfield Court.*

COPROSMA BAUERIANA VARIEGATUM.—This makes a showy specimen for a large conservatory, where numerous foliage plants are grown. The rich yellow of the variegated leaves show to advantage when the shoots are trained flat to a balloon-shaped trellis. *S.*

CHRYSANTHEMUM SPORTS.—In last week's *Gardeners' Chronicle*, p. 576, there is an article upon sporting, and it is said that *Etoile de Lyon* bears two kinds of flowers (which I do not dispute), the crown or single buds being pure white, while terminal buds are a lilac-rose. With us this season we have no such distinction, but we have a white bloom and a lilac bloom upon the same plant, and both were crown-buds. We have several plants, but the sport

has only appeared upon one, and this plant has only two flowers, both crown-buds, the one white, and the other lilac. *Stanstead Surprise* is indeed a surprise, for we have no less than three sports, and all different, but none of which are better than the original. I enclose sports from several, and also the two *Etoile de Lyon* flowers. *W. A. Cook.*

PRIZES AT THE BOTANIC.—At the Royal Botanic Society's fête, held at Regent's Park on July 8 last, I was awarded a prize, value £5, for an exhibit. Not having received either the prize or any reply to two letters I have addressed to the secretary on the subject, I shall be glad if you will be good enough to insert this, in order that future exhibitors may know what to expect. If the society has not funds available with which to distribute their prizes within four months of the date on which they are awarded, it seems scarcely right to offer prizes, which are intended to induce exhibitors to furnish the tents, and without which inducement there would probably be no exhibits. *A Prize Winner.*

CIDER MAKING.—(See also p. 619). In reply to your question from "H. W., Hereford, p. 591, we have pleasure (as one of the chief wholesale sugar dealers in England), in enclosing a pamphlet on the use of sugar in cider making, compiled by us some years ago. This question is really of considerable importance if the fruit crops of this country are to be properly developed. Our cider, generally speaking, is made by rule of thumb, and the farmers or manufacturers are quite at a loss to understand its variations in quality from year to year. In the same way they have no clue to the varying times for which their cider will keep. A little scientific inquiry would show them, however, that the whole of these variations are due chiefly to the varying proportions of saccharine in the raw Apples. In a damp sunless year like this, the proportion of saccharine would be very small, and the same Apples in a very sunny year might be far sweeter. The amount of sugar to be added has to be governed by the amount of saccharine in the fruit, and this can only be ascertained by the use of a cider saccharometer. One adapted to French measures and called "*pèse cidre*," has been invented by Mons. Vivien, a well-known French chemist, and we believe a cider saccharometer adapted to our pounds and gallons can be had of Messrs. Negretti & Zambra, Holborn Circus. The inferiority of British cider to that made abroad is well known to all those who have visited Normandy. The production of cider in France is over 226 million gallons a year, and a great deal of sugar is used in its preparation. Sugar is also used to a large extent in the manufacture of American cider, which is actually exported to this country where the best sugar cider in the world could be made. In the pamphlet we send you, London pearl sugar is recommended, but the manufacture of that quality has been discontinued, and its place could best be taken up by German granulated, which would be sold in 2 cwt. bags by any grocer at 17s. or 18s. per cwt., according to the carriage and the quantity taken. It is specially to be noted, that it is during the process of fermentation that sugar can be properly added to cider. When so added, it is converted into alcohol, and enables the liquid to be kept for any length of time. If added after fermentation, it is simply an adulteration to conceal bad flavour, and the addition ensures the rapid deterioration and destruction of the cider. Unconverted sugar, in the same way, is unwholesome, while the converted sugar is not so. *Travers & Sons, Limited.*

AUTUMN-FLOWERING PLANTS.—In a large herbaceous border I saw the other day, the following were bright and flourishing, even after the wretched "rain of terror" we had last month. They were the white *Tradescantia*, *Physalis Alkekengi* or the Winter Cherry, *Calceolaria hyssoaphylla*, which did not seem the least affected, and whose pretty foliage was covered with bright golden flowers; *Agathaea celestis*, *Cuphea*, *Nicotiana glauca*, the *Heliotropes*, and *Cnothera taraxifolia*. To the last-named hangs a tale: a visitor, who was very fond of giving advice, reported to the proprietor that the border was full of Dandelions, whereat the canny Scotch gardener scolded all along the line. *Vagabond.*

HARDY PERENNIALS.—I would mention as just occurring to my mind, the herbaceous *Polygonum* as answering to my classification of hardy herbaceous shrubs. These are too hard-wooded to be classed with ordinary herbaceous plants, and in all respects bear more resemblance to shrubs than to border flowers. I do not see that some *Hydrangeas*

differ much from these when the annual growths die back, as is often the case, to the lower buds of the previous summer growth. They then become nearly herbaceous shrubs. The point raised in this particular instance shows in one direction the extreme difficulty there is in determining the nature of strictly herbaceous plants on the exhibition table, whilst the interesting case which arose at the recent Chiswick Conference, when collections of hardy flowers were disqualified because they included bulbous flowers, which were not recognised by the judges as hardy perennials, shows in another direction how great is the need for some clear and authoritative definition of what are hardy perennials, what are hardy herbaceous plants, and what are not. The decision of the judges at Chiswick gave rise to much adverse comments, chiefly perhaps because the grounds of their decision were not understood. I take it that they regard bulbs as of annual production root and plant, and therefore whilst still reproducing their kind annually are yet not perennial strictly. At many exhibitions the rule has been to allow almost anything to be shown under the term hardy flowers, and this laxity of interpretation leads to the making of numerous mistakes. *A. D.*

BLUE MICHAELMAS DAISIES.—The Michaelmas Daisies never in this garden approached the colour of true blue so nearly as they have done since the clear frosts and sunny days of last week. I send a few gathered this morning, November 2. They belong to the section known as *Aster novi-belgii*. Asa Gray describes several of these as having rays of "bright blue;" and in their own country, where they are sure of fine frosts during their flowering season, no doubt a better colour is usual than in England, where the first frosts are likely to find them drenched with rain. But most gardeners must have noticed that cold nights always improve the colour of all Michaelmas Daisies. *C. Wolley Dod, Edge Hall.*

RHUS TOXICODENDRON.—*Apropos* of the recent observations contained in your columns pertaining to antidotes of the poisonous properties of this plant it would be interesting to learn, if the common potash-soap alluded to by your American correspondent, has also proved an efficacious antidote in cases of eczema caused by the handling of *Primula obconica* plants and flowers. The writer is cognisant of cases that have successfully been treated by the application of a solution of Fir-tree Oil and warm water to the affected parts, also by a like application of Condy's Fluid. *W. G., Harborne.* [Take care that the skin is not broken before you try such experiments. Ed.]

POTATOS.—As usual, the *Magnum Bonum* has proved our sheet-anchor, inasmuch as the crop of it has turned out far larger and sounder than that of any other variety of Potato grown by us, most other sorts having been badly diseased when taken up, and the disease has spread greatly in the tubers of some varieties since that time. The American varieties are, as usual, the worst this year, *Beauty of Hebron* being very bad, and fully one-third have rotted, decay having set in. *Imperator* is generally good in the field, but they are coarse and rough, owing to the excessive wetness of the season. Potatoes were cheap at one time, owing to the markets being glutted; but I am of opinion that higher prices will rule for sound lots long before the winter is over. *J. Sheppard, Woolverstone Park.*

THE EDUCATION OF GARDENERS.—I should like to say a few words on this subject, which is one of importance to us all, at the same time I fear that a thorough practical and scientific education in horticulture avails little towards a man's future success and eminence, if he do not possess influential friends who are willing to afford him their assistance. Remember, gardeners' situations at the present time are not got by merit, but by favour, by having useful friends and recommendations; it matters little as to capability. I can give several instances of uneducated and ignorant men, who can scarcely read, much less write, holding situations where three and four men are kept. Their practical experience will not cover more than five years, and these situations have been obtained for them by their friends, to the exclusion of educated and much more experienced men. It is to be regretted that such a state of things should exist; but undoubtedly it is sometimes true. I am at present contemplating leaving the profession for one which will pay me better, though my experience extends over fifteen years amongst Vines, Figs, Pines, Peaches, Orchids, stove and greenhouse plants, kitchen, fruit, and flower gardens. Referring

to the scientific portion, I have attended classes and privately studied botany, agriculture, meteorology, chemistry, geometry, mensuration, surveying, and levelling. I have written and read essays upon various branches of gardening before gardeners' and mutual improvement associations. I have also contributed articles to several gardening periodicals, given public lectures upon horticultural subjects, illustrated by the magic lantern, the slides of which I carefully prepared myself. My moral character is all that one could desire, yet, for the want of influential friends, my labours to obtain knowledge and gain an honourable position in the gardening world are frustrated—to live in oblivion seems my doom. When advertising for a situation, the following is a copy of a letter one often gets. This one I have received myself:—"Mr. — is in want of a gardener, married, but with no family. The gardener is required to clean boots and knives, and make himself generally useful. There is a kitchen and flower garden, but only one small greenhouse. The gardener's wife is expected to clean the church, the gardener lighting the stove. The man must have a thorough knowledge of gardening. Wages, £1 per week, and a house. If this suits the advertiser, send references to last employer." Brethren in the profession, I ask you, what encouragement is there for a young man? I encourage education on every hand, for it will ultimately place things on a better footing. I said, "Leave the profession for a more lucrative one." Well, one who cannot make £1 per week is doing poorly; in fact, I see it made with illiterate and easy-going fellows, who are not required to work like gardeners, much less having the responsibilities. Let us labour and wait till the tide turns. *Hopeful.*

FLAVOUR IN PEARS.—The flavour of Pears this season is not so good as usual, even in the best varieties. This points to a moist cool summer, which is never favourable to developing flavour, and in localities naturally damp, the want of flavour will be worse than on high and dry soils. We have some trees which stand on land 25 feet higher than others, and from these trees our finest flavoured Pears this season have been gathered. The general lateness of ripening will be an advantage, by prolonging the season of the Pear, and where the fruits have been carefully gathered and stored, they will keep well. One often wonders why it is that so very few of our finest-looking Pears are met with elsewhere than on the exhibition table; there must be something wrong with the flavour of these varieties, their fertility is not sufficient to merit their being planted extensively, for of what use is a fine looking fruit if it be not good eating? I for one would not cumber the ground with them. I inquired at a show this year what the merits of certain fruits were, and the reply was that the varieties were not of much good for table use but they were fit for exhibiting, the flavour being poor. Mere size should not count for much in a dessert Pear, but this is lost sight of by some judges, who do not, as a rule, ascertain the merits or otherwise of the varieties shown. I should say, for instance, that a dish of fine Winter Nelis Pears was a long way ahead of one of General Toddleben, and a dish of Comte de Lamy to be preferred to one of Doyenné Boussoch. These are but a few instances out of many which I might cite. I know that soils affect the quality of Pears, but speaking generally and from experience, if a fruit-grower be asked to supply a dozen good Pears, he would not include either of those I have condemned. *Wiltshireman.*

CERTIFICATES AT THE R.H.S.—"We print this letter as expressing the opinion of many at a distance." These words (editorial remarks) at finale of article headed "The Orchid Committee," at p. 557, in a recent issue, express (as I know from practical experience) the exact opinion of many provincial "heads" throughout the kingdom—who rightly or wrongly strenuously adhere to the principle that certain of their metropolitan brethren are unduly favoured, not only in the granting of Orchid certificates, but for horticultural produce generally. If this sentiment is wrong, it will be found well worth the while of the Royal Horticultural Society to reply to "Justitia's" complaint, and explain away this impression. For that such exists—and strongly too—one has only to travel throughout the provinces to perceive how fixed a hold it has in the minds of the provincial horticultural community. Another impression is, that certain houses or firms can positively secure a certificate for almost "anything." Now as one who has seen the "inner workings" of houses who are looked upon as belonging to that "charmed circle,"

and others who are "not," the writer has to admit (without the slightest prejudice) that the "success" of the one, and the "non-success" of the other in the question of securing "certificates" has often appeared "passing strange." Surely, for the benefit of the horticultural world, this impression—if wrong—can be removed. *Pioneer.* [It can only be removed by the objectors coming and judging for themselves and not trusting to rumour. Ed.]

THE INTERNATIONAL FRUIT SHOW AND THE FRUITERERS' COMPANY.—All that you say about the Fruiterers' Company and the Horticultural Society is very true. What it means is this:—All that has hitherto been done in the way of studying fruit and fruit-culture has been done by the Horticultural Society. A very great deal more work has to be done yet, before we really know anything of many kinds that are grown in various parts of England, and of the comparative merits of these and of well-known kinds in different parts of England, and in different soils. The Horticultural Society is the only body that could undertake this work, and I have always hoped that as the Society got into a better position, and with the help of all who were interested in fruit culture, both by finding it funds, which were much needed for the purpose, and also by personal co-operation, it would undertake this. No doubt, the Fruiterers' Company was not intended to be set up in opposition to the Horticultural Society, but the effect of it is to withdraw from the Society the support which it needed to carry on its work, and practically to make all useful work in the matter of fruit-growing impossible, and to fritter it all away in show and sham and talk. The Company knows nothing of the different qualities of fruits in different soils and different parts of England; they do not

FIG. 83.—NEW VERBENA: UPRIGHT HABIT, BLOOD-RED COLOR.

propose to themselves to learn this, and if they did so, they could not do it; and if they do talk people into planting fruit trees without knowing this, two-thirds of it will end in failure and disappointment, and they will have done more harm than good. An international fruit show can teach us nothing that we do not know already. I consider, therefore, that the Fruiterers' Company has made it useless to think of doing any good in the matter of fruit-growing. It has practically made it impossible for the Fruit Committee of the Society to carry out any intelligent scheme of fruit culture, and I have therefore ceased to take any interest in the matter. I do not suppose that I shall ever go again to the Fruit Committee, and, of course, I am not likely to have anything to do with the Fruiterers' Company. *C. W. Strickland, Hildenley, Malton.*

CONTINENTAL NOVELTIES.

VERBENA HYBRIDA ERECTA COMPACTA ATROSANGUINEA.

This is alleged to be the finest, most erect, and compact-growing Verbena in cultivation [with such an array of names it ought to be. Ed.]. It was raised and introduced a few years since by Messrs. C. Platz & Son, seed growers, at Erfurt, Germany. Until the past year, there only have been introduced three colours of this type—carminea, coccinea, and violacea—which still retain their true character when grown from seed. The advantages of this new type are, that the branches and spikes are arranged round the principal stalk in a strictly upright position, therefore they require no pegging down. In this year Messrs. C. Platz & Son have been so successful as to

add to the above-mentioned three colours a fourth—atrosanguinea. This novelty, with its fine compact and erect-growing habit, is with its velvet-like dark blood-red colour certainly a fine variety. Moreover, a fact of importance is, that this new variety is nearly constant when grown from seed, only a few are running back to scarlet. *Erfurt.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

NOVEMBER 10.—Present: Dr. W. T. T. Dyer, in the chair; Dr. Masters, Dr. Muller, Mr. McLachlan, Mr. Morris, Dr. Russell, Rev. W. Wilks, Mr. Lynch, Mr. Blandford, Professor Church, Dr. Bonavia, Mr. Michael, Mr. Pascoe, and Rev. G. Henslow, Hon. Sec.

Pear Spot.—The disease upon Pears brought to the last meeting proved to be due to *Fusicladium dendriticum*, Walt., a common parasite.

Hunting Spider.—With reference to this insect, referred to at the last meeting, Mr. Morris observed that it proves to be very widely distributed. The male appears to be most commonly seen; he had observed it at the gardens of Sir J. Llewellyn at Penllergare.

Wallflowers with Clubbed Roots.—Mr. Lister, to whom the specimens were sent from the last meeting, reports as follows:—"I have not studied the life-history of *Plasmodiophora Brassicæ* sufficiently to speak with entire confidence with regard to the disease which has attacked the roots of the Wallflowers; but I think there can be little doubt that they are affected by the same parasite as causes the clubbing of Cabbage roots. I enclose a drawing from a section of one of the roots, from which it will be seen that one half has not been attacked, while the other half is much swollen by abnormal growth of all the parts. The cells are larger and rounder than in the sound portion, and among them are vast numbers of large chambers formed by the breaking down of cell walls, and these are filled with the spores of the *Plasmodiophora*. They are most abundant in the cortex, though both the phloem and the outer part of the xylem are largely affected. The organism would seem to be in the condition described by Zopf, where all the plasmodium (if that word can properly be used in this case) has changed to spores, which would escape when the diseased root rotted away. *Plasmodiophora* is not included by De Bary with the eu-Mycetozoa, and Zopf places it with the Monadinæ.

Cunonia capensis.—Dr. Masters exhibited specimens showing interpetiolar stipules and glandular processes, apparently secreting a resinous matter. It was the only instance known in Saxifragaceæ, though similar facts were well known in Cinnabaceæ and Rubiaceæ.

Pinus halepensis.—A spray was received by Dr. Masters from Baron von Mueller, bearing both male and female flowers on the same shoot; the female flowers being in clusters instead of in pairs and arranged in the same series as the male catkins.

New Insect in St. Helena.—Mr. Morris read a communication from Mr. W. Grey Wilson, Governor, referring to some insects forwarded (in two stages), which he feared might prove dangerous. They were taken from a Rose bush, the branches of which were densely covered with a large white insect and a small red one. It appeared to resemble some species of *Leerya*. It was sent to Mr. Douglas for examination and report.

The Injury of London Fog to Plants.—Dr. Dyer called attention to some discrepancies between the published analyses of the deposits collected at Chelsea and Kew—more particularly in the hydrocarbons—given in Dr. Russell's paper in *Nature*, November 5, 1891 (s-e p 607). Thus, the hydrocarbons and organic bases are recorded as 12.3 and 2 per cent. respectively at Chelsea, whereas at Kew they were collectively only 4.8 per cent. Similarly, the metallic and magnetic oxides of iron were 10.6 and 2.6 per cent., and mineral matter (chiefly silica and ferric oxide) was 31.2 per cent. at Chelsea. These taken collectively at Kew were 41.5 per cent. Dr. Muller did not attach very much importance to these differences, and Professor Church thought it would be desirable to differentiate more accurately between the silicates. The general opinion was, that it would be desirable to collect fresh deposits in the ensuing winter, and re-examine them.

Porana paniculata.—Mr. Lynch exhibited a spray of this plant of the order Convolvulaceæ, received from India through Dr. Bonavia, who described it in 1885 (*Gardeners' Chronicle*, vol. xxiii., N. S., p. 47). It was the first occasion of its flowering in England. The Committee complimented Mr. Lynch on its successful cultivation.

Ixodidae (Ticks) from Antigua.—Mr. Michael exhibited specimens taken from ponies, and received from Mr. C. A. Barber. They were two females of a *Hyalomma*, probably *H. dissimile*, Koch; which Koch described some thirty years ago from specimens taken in Mexico. The creatures are bred on plants and trees, and attach themselves to passing animals, being then quite small; the male remains so, but the female sucks the blood of the animal and becomes enormously distended. They anchor themselves by their rostra, which are provided with recurved hooks; the Ixodes can then withdraw the rostrum, and being full-fed, drops off, matures and lays its eggs on the plants. The specimens sent had sucked and were much distended, but had evidently withdrawn their rostra, as these organs were perfect, whereas the claws with which they were holding on were all torn off.

Specimen of Agaricus melleus attached to its mycelium (Rhizomorpha).—Mr. Mowright forwarded specimens, with the following communication:—"It is not very long since our British mycologists ridiculed the idea that *Agaricus melleus* was a parasitic fungus, capable of destroying living trees. For many years the heterocœous-like history of *Puccinia graminis* was similarly scouted as absurd. This, however, is now a thing of the past. In the specimen of *A. melleus* sent herewith, a group of young specimens are seen *in situ* attached to the well-developed rhizomorphoid mycelium. The specimen was removed from an Ash tree in the park of Hammond Lodge, Terrington, St. Clements, in the month of October last. Such specimens are not easy to preserve; but in the present case this has been accomplished fairly well. The group of Agarics, which were quite young, had just emerged through the bark of the tree; by carefully cutting away the bark the mycelium was brought into view between the bark and the wood. A piece of the mycelium, 3 or 4 inches square, was removed with the Agarics *in situ*. Attached to the under side of the mycelium will be observed two fragments of the wood (Ash) already decayed by the subtle agency of the mycelium."

Agaricus squarrosus, a true Root Parasite.—"The parasitic nature of *Agaricus squarrosus* is as well marked as that of *A. melleus*, although this feature in the life-history of the fungus has not hitherto, to my knowledge, been pointed out. It attacks Beech, Apple, and Ash trees. The specimens sent herewith were obtained from an Ash tree near King's Lynn. The tree is a fine well-grown specimen, growing on the roadside. Last October I observed clusters of *A. squarrosus* growing out of the ground a couple of feet from the stem. On carefully removing the turf, I was able to trace the base of the stems of the Agaric attached to a compacted mass of white mycelium, earth, and small stones to one of the main roots of the tree. It will be observed that a portion of the woody tissues of the root permeated by white mycelial hyphæ is still attached to the basis of the stems of the cluster of the Agarics. Having watched trees attacked by this parasite for some years, it appears that its destructive influence upon the tree it attacks is not nearly so rapid as that of *Agaricus melleus*. This is accounted for by the fact that the mycelium of *A. squarrosus* is not nearly so well developed a structure as that of *A. melleus*. The hyphæ are not compacted into such thick cord-like structures; still, however, a tree once attacked by *A. squarrosus* is practically doomed. This fungus is very destructive to the Apple trees in the orchards of Herefordshire, where it is a well-known pest. It very probably attacks other deciduous trees, but the three above-named are the only ones upon which I have observed it growing as a parasite."

Dr. Dyer observed that *A. melleus* is now well known as doing serious mischief through its parasitic habit, and mentioned that where roots are exposed and subject to abrasion by cartwheels or otherwise, the Agaric is known to attack the decorticated place.

YEOVIL CHRYSANTHEMUM SHOW.

NOVEMBER 10.—On the above date the Yeovil Chrysanthemum Society held its annual exhibition in the Town Hall, and it was in every respect the best show yet held in Yeovil.

Groups were a strong feature. Mr. Crossman, gr. to J. Brutton, Esq., Yeovil, was 1st, his plants being clothed with rich foliage and large flowers. The 2nd and 3rd prizes went to Messrs. Gear and C. Anthony, both of Yeovil, for good groups. Out of three good groups of miscellaneous plants, Mr. Biss had the best.

Messrs. Crossman, Anthony, Gear, Allen, and Barrett were the most successful exhibitors of trained plants.

Table Plants were shown well by Mr. Gallop, gr. to H. N. Middleton, Esq., Bradford Peverell, Dorchester; Rev. M. Hankey, Maiden Newton; and Mr. W. E. Hall, East Coker, Yeovil.

Mr. C. Anthony had the best half dozen plants of double white Primulas, and Mr. Gillingham was 1st with six plants of the single-flowered variety. Mr. Felix Drake, East Coker, secured premier award for six well-grown Marie Louise Violets.

Cut Blooms were shown extensively and well; the principal class being that provided for twenty blooms. Mr. Copp, gr. to W. E. G. Erle-Drax, Esq., Holnest, Sherborne, secured premier position in a good competition; Mr. Lloyd, gr. to Vincent Stuckey, Esq., Langport, was a creditable 2nd; and Mr. Wilkins, gr. to Lady Theodora Guest, Inwood House, Henridge, 3rd. Mr. Lloyd was 1st in both classes for twelve incurved and a like number of Japanese.

Three collections of fruit were staged, Mr. Lloyd securing 1st place. The same exhibitor was 1st for two bunches of Black Alicante Grapes, and for two bunches of any other black, with large, well-coloured clusters of Gros Colmar. Mr. Gallop took 1st for two bunches of Muscat of Alexandria, and Mr. Wilkins took similar honours in the any other white class, with good bunches of Trebbiano.

Apples and Pears were well shown, Mr. Gallop being the principal prize-winner.

Several excellent collections of vegetables were staged in the amateurs', cottagers', and open classes. The most successful exhibitors in the open classes were Messrs. W. E. Hall, Crossman, Allen, and Copp. Two well-arranged collections of salading were put up by Messrs. Allen and Crossman.

Messrs. Robert Veitch & Son, Exeter, contributed sixty dishes of large, well-coloured Apples; Messrs. Jarman & Son, Chard, staged fifty dishes of good fruit; and Mr. Davis, Yeovil, twelve dishes of Pears and Apples.

KINGSTON AND SURBITON.

NOVEMBER 10, 11.—This old and popular show retains all its vitality and interest. The present exhibition is a fine one, nearly all classes well filled—some exceptionally well; and the general quality of the best. Not only is such the case, but there is a marked advance in the average quality of the exhibits, so that the judging was very arduous.

Miscellaneous Plant Groups were very pleasing, only needing a little more colour. The best of these came from Mr. G. J. Cook, gr. to J. G. Sassoon, Esq., Walton-on-Thames; Mr. Reeves, gr. to General Annersley, Otlands Park, and Mr. H. Farr, gr. to H. Speer, Esq., Thames Ditton, coming 2nd and 3rd.

Chrysanthemum Groups were a very fine feature, six being staged. All were good, but the 1st and 2nd were exceptionally so. The best was arranged by Mr. R. Mitchell, gr. to W. Cunard, Esq., Twickenham; Mr. Milham, gr. to A. T. Miller, Esq.,

Trained Plants.—These were excellent; the six from Mr. Sallowe, gr. to Miss Vaughan, Twickenham, were superbly flowered, and some 3½ feet across. The best sorts were white and pink Christine; Mrs. G. Rundie, and Mr. G. Glenn; and Catherine Wheel, Japanese. Mr. R. Cawte had the best three in Japanese, Mr. Reeves being 2nd. The best plants were Elaine, Val d'Andorre, Maiden's Blush, Madame Sévin, &c. Mr. Cawte had the best three standards, and Mr. Reeves the best specimen Pompon in Anemone Marie Stuart. Other Pompon plants were large, but not too well done. Chinese Primroses were numerous, Mr. J. Buss, gr. to A. W. Aston, Esq., Epsom, having the best six singles in capitally-flowered Princess of Wales, and Mr. Milham the best six Doubles, amongst which was a capitally bloomed Annie Hillier.

Table Plants were very numerous and of the usual kinds. Mr. Wilkins, gr. to J. N. Pearson, Esq., Kingston, had the best nine; and Mr. Sage, Ham House Gardens, the 2nd best. Mr. Portbury had the best six berried plants, in red Capsicums; and Mr. Sage was the only exhibitor of Bouvardias, fairly well-flowered plants of Alfred Neuner.

The Challenge Vase.—The competition for this handsome trophy invariably elicits great interest

and keen competition. This time there were six lots of forty-eight blooms, twenty-four incurved, and twenty-four Japanese, staged. The Cup, won last year for the first time by Mr. Bryant, Juniper Hill, Dorking, is really a handsome silver bowl, costing some £27—a splendid prize. On this occasion it fell to Major Collis Browne, of Byfleet, whose gardener, Mr. Carpenter, put up some really high-class flowers. This competitor has ascended the ladder from fourth only four years since to the 1st place now. Mr. Mease, gr. to A. Tate, Esq., Leatherhead, was 2nd.

The class for twenty-four incurved blooms was a large one, the finest lots coming from Mr. W. Mease—capital flowers; Mr. C. Beckett was 2nd;

In the class for twelve blooms, Mr. Felgate, gr. to the Duchess of Wellington, Walton, put up some splendid flowers, really of first class quality; and Mr.

The best six incurved came from Mr. Hopkins, gr. to T. Wooderspoon, Esq., Walton; and Mr. Carpenter had in splendid blooms of Violet Tomlin, the best six of any one variety, the 2nd best being Lord Alcester, and the 3rd Empress of India.

Japanese blooms were very beautiful, the best twenty-four coming from a notable grower, Mr. Trinder, gr. to Mr. Henry Mildmay, Dogmersfield Park, Winchfield; Mr. R. Cawte and Mr. W. Mease had the next best lots. Mr. Felgate was 1st with twelve blooms; Mr. Milham was 2nd. Mr. Quarterman, gr. to C. E. Smith, Esq., Cobham, had the best six blooms, and of one variety the best were capitally coloured Etoile d'Yvon, from Mr. Felgate; E. Molyneux, from Mr. Carpenter, being 2nd. Mr. G. Woodgate, the secretary, gr. to Lady Wolverton, Coombe Warren, was a good 1st, with twelve Pompons, in bunches of three blooms; he was also 1st for twelve Anemone Pompons, of reflexed flowers. Very fine indeed were the blooms from Mr. Carpenter. Mr. R. Cawte was 2nd. Of large Anemones, the best twelve came from Mr. R. Cawte, Mr. Woodgate being 2nd.

Some special classes of a mixed character brought strong competition. For Messrs. J. Laing & Son's prizes for twelve Japanese and twelve incurved blooms, a beautiful lot of flowers was staged. Mr. R. Cawte, Mr. Woodgate, and Mr. Coombs taking the prizes in that order.

In the class for six Japanese, six incurved, and six Anemone—the prizes given by Major Collis Browne, Mr. Cawte was again 1st.

In a further class for six Japanese, six incurved, and six reflexed—the prizes given by Mr. Sissons Hyde, Mr. W. Mease was 1st.

There were numerous local classes, also various epergues, bouquets, and similar decorations.

Fruit was excellent. Mr. C. Griffin, gr. to the Misses Christy, Coombe Bank, had in Muscat of Alexandria the best white Grapes, and in Alicante the best black.

[Fruit was extensively shown, but exigencies of space forbid our mentioning more than the names of the successful exhibitors, viz.:—Mr. Mease, Mr. C. J. Waite, Mr. Tubbs, Mr. Miller, and Mr. Taylor.]

THE KENT COUNTY SHOW OF FARM FRUITS.

NOVEMBER 10, 11.—This Society held its third annual exhibition of hardy fruits in the Corn Exchange, Maidstone, on the above date, and the exhibits were of a high-class nature, Apples and Pears being specially good.

The only class open to landowners or their gardeners, nurserymen, &c., was one for twenty dishes of fruit, open-air grown. Roger Leigh, Esq., Barham Court (gr. Mr. Woodward), easily secured the premier position, every fruit being without spot or blemish; Mr. Thomas, Sittingbourne, was placed 2nd, with a remarkably clean lot; and Lady Fletcher, The Kenwards, Yalding (gr. Mr. Smith), took the 3rd position, his best dishes being of Pears.

The class for twelve dishes, farm-grown, each dish to consist of twelve fruits, distinct, brought out a fine display. The 1st prize was easily won by Mrs. Fremlin, Teston, with a most meritorious collection; Mr. Goodwin, Mereworth, took the 2nd position, with highly-coloured fruits; and Mr. Thomas was 3rd.

For dessert Apples, one sieve, Mr. Thomas was well to the fore, showing fine Cox's Orange; 2nd, Mr. Manwaring, Brenchley; 3rd and 4th, Mrs. Fremlin and Fearon, Mereworth. For cooking Apples, Mr. G. Chambers, 1st; Mr. Goodwin, 2nd; Messrs. Warde and Fearon following respectively.

Dessert Apples, four quarters, Mr. Goodwin was 1st; 2nd, Mr. Thomas; 3rd and 4th, Mrs. Farmer, Leeds, and Mr. Fearon. Two ditto, Mr. Fearon

took the lead; 2nd, Mr. Blest, Wateringbury; 3rd, Mr. Bryan, Mereworth.

For four quarter-sieves cooking Apples, 1st, Mr. Levey, West Farleigh; 2nd, Mrs. Fremlin; 3rd, Mrs. Farmer. Two ditto, Mr. Warde, Farleigh, secured 1st prize, with capital fruits; 2nd and 3rd, Messrs. Fearon and Bryan respectively.

Pears, two quarters, Mr. Blest, Wateringbury, 1st, showing very large Pitmaston Duchess and Marie Louise; 2nd, Mr. Goodwin; 3rd, Mr. Thomas.

For a collection other than specified in the schedule, there was only one competitor, whose exhibit was not of sufficient merit to deserve the 1st prize, and was awarded the 2nd.

In the class for dried fruit, there was ample room for improvement; and, it is to be hoped, another year these two classes will be better represented.

TORQUAY.

NOVEMBER 11.—A capital show was that held by the Torquay Horticultural Society in the Bath Saloon, which site affords plenty of space for the disposal of the exhibits, and plenty of room for visitors. The groups of Chrysanthemums were arranged in circles and squares on the floor of the large hall, and groups of miscellaneous plants around the sides, making a pleasing effect. The cut blooms were placed on tables in rows in another room, relieved with small plants between the rows of boxes. Fruit and vegetables required still another room, so numerously were they shown.

Cut blooms formed the most important part of the exhibition, and were staged not only in large numbers, but of good quality. The principal class was that for thirty-six, distinct, for which five competed, the 1st prize being a Silver Cup, which was easily won by Mr. G. Foster, gr. to H. Hammond Spencer, Esq., Glandaragh, Teignmouth. The best blooms were Mr. S. Coleman, Jeanne d'Arc, Lord Leicester, Golden Empress, Princess of Wales, and Violet Tomlin in the incurved section; Mr. W. Cole, William Lane, Puritan, Stanstead White, Sun-flower, and Louis Behmer among the Japanese. Mr. J. Stiles, gr. to Miss Fripp, the Grove, Teignmouth, was 2nd, showing good blooms.

For twelve incurved, the last-named won premier honours, with even blooms; 2nd, Mr. A. Searle, gr. to J. N. Whitehead, Esq., Torquay, who also secured the leading award for twelve Japanese, with massive examples.

The best six large Anemone blooms (Japanese excluded) was well won by Mr. Foster; Mr. Searle following. For six Japanese Anemones, Mr. Searle won; Mr. W. H. Veale, gr. to the Rev. A. H. Sims, Wolborough Rectory, 2nd.

Mr. J. Stiles had the best six reflexed, distinct; and for six of one variety, the same section, Mr. Stiles also won with wonderfully fresh blooms of Cullingfordii. Mr. Foster, with extremely fine blooms of Mrs. Judge Benedict, secured premier position for six any Anemone variety; Mr. Stiles following.

For six incurved, one variety, Mr. Foster was 1st, with full-developed Empress of India, Mr. Searle 2nd. The same exhibitors occupied similar positions for six blooms of any white Japanese, with good examples of Stanstead White; Mr. Searle, 2nd, with Avalanche.

With good blooms of Boule d'Or, Mr. Searle took 1st for six yellow, any variety; Mr. Foster, 2nd, with W. H. Lincoln. With very fine Etoile de Lyon, Mr. Foster won 1st, for any one variety; Mr. Searle 2nd. Mr. Stiles, with same variety, took 1st for twelve of any Japanese variety. The premier incurved bloom was a very shapely one of Mrs. S. Coleman in Mr. Foster's stand. Mons. Bernard, in Mr. J. Stile's stand, was awarded a similar position in the Japanese class.

Groups were a capital feature of the show. For plants arranged in a circle of 8-feet diameter, in not less than eighteen varieties, Mr. A. Searle was a good 1st. Mr. J. Hunt, gr. to P. B. Drinkwater, Esq., Lyncombe, Torquay, 2nd. Mr. W. Satterly, gr. to Mrs. Matthews, Braddon Villa, Torquay, won leading honours with a smaller group; 2nd, Mr. Ferris, gr. to J. W. Kimber, Esq., Tracy, Cockington.

For a collection of miscellaneous plants, arranged for effect, Mr. J. Slowman, gr. to Captain Fane Tucker, Braddon Tor, Torquay, with a pleasing display; Mr. W. Satterly was 2nd. Specimen plants were rather poor.

Orchids were well shown. In the class for three, Mr. G. Lee, gr. to W. Lavers, Esq., Upton Leigh, Torquay, was 1st, staging Oncidium ornithorynchum, Cypripedium Harrisianum, and Miltonia candida;

Mr. G. Medland, gr. to M. Sparke, Esq., Rooklands, Torquay, 2nd. The best specimen Orchid was a well flowered one of Cymbidium giganteum superbum; Mr. Medland 2nd, with a good specimen of Cypripedium Spicerianum.

Groups of plants "not for competition" were contributed by Messrs. Horn & Sons, St. Mary's Church, Torquay; Messrs. T. Allward & Son, Braddon's Hill, Torquay; Messrs. Curtis & Sandford, Devon Nurseries, Torquay; and Mr. W. B. Small, Torquay, which assisted much in adorning the sides of the large ball.

Messrs. Veitch & Son, Exeter, staged a very fine collection of Apples, such sorts as Lord Derby, The Queen, Alexander, and Mère de Ménage.

READING, CHRYSANTHEMUM, FRUIT, &c.

NOVEMBER 11.—Groups of Chrysanthemums made a grand display at this show, being arranged around the smaller hall. They were, however, too much crowded together to give the best effect, a little more room between each one would have been a decided improvement. Mr. Booker, gr. to B. Monck, Esq., Coley Park, was 1st, his flowers being extra fine blooms; 2nd, Mr. Knowles, gr. to W. Crisp, Esq., Henley, who came up extremely close to his more fortunate competitor, having better varieties in colour; Mr. Turton, Maiden Erleigh, was a good 3rd, he had Louis Behmer in better condition as to colouring than it is often seen.

In the smaller group class, the best came from Mr. Smith, gr. to Miss Russell, Lothair, who staged well-grown plants.

Specimen plants were very well done, the most prominent being the standards, which are always a feature at Reading. Mr. Surnam, gr. to M. H. Best, Esq., Donnington, was 1st, with plants in profuse flower. Mr. Booker was 2nd, with some good plants; two well-bloomed Anemone-flowered varieties gave this exhibit a novelty.

Bush-grown plants were much the best from Mr. Frost, gr. to Walter Palmer, Esq., Westfield. These were not of too formal a character. The best Pompons came from Mr. Richards, gr. to Rev. R. McDonald, Ascot. The plants were also freely grown, the best style for the section.

Cut flowers were quite up to the standard of the season. Mr. Neville, gr. to F. W. Flight, Esq., Twyford, was a good 1st for eighteen incurved varieties. The blooms were even, of good colour, fine in size, and fresh. Mr. Lane, gr. to Miss Smith, Ascot, came in an excellent 2nd. With twelve incurved varieties, Mr. Walker, Thame, proved victorious; Mr. Allen, gr. to Sir G. Russell, Bart., Swallowfield, also showing well.

The best twelve reflexed were from Mr. Popple, gr. to Sir A. Stepney, Bart., Ascot, with very superior blooms; Mr. Richards being 2nd. For eighteen Japanese, Mr. Lane was to the front in a strong class, Mr. Neville following; in both cases the blooms were large and fresh. With twelve reflexed Japanese, Mr. Richards came well to the front, Mr. Walker being 2nd, and for twelve incurved Japanese, the 1st prize went to Mr. Ashman, gr. to C. D. Crews, Esq., Billingbear, and the 2nd to Mr. Lane.

The class for cut blooms, with at least 8 inches of stem above the boards, was a strong one, ten exhibits, being better filled than most classes. Mr. Hughes, gr. to H. F. de Paravicini, Esq., was 1st, the blooms standing up well, with healthy foliage below them; Mr. Knowles, gr. to W. F. Crisp, Esq., Henley, had also some very fine incurved blooms in the 2nd prize stand. The best cut Pompons were large bunches from Mr. Surnam. For twelve Anemone-flowered, Mr. Richards was 1st, with two varieties only; the 2nd prize stand having a much better selection—these were from Mr. Turton.

Of new varieties, Mr. Owen, of Maidenhead, showed Lakine, pale blush incurved, with broad petals; M. Bredemier, rosy-purple Japanese; Mrs. Robinson King, a sport from Golden Empress, with the colour of Jardin des Plantes; Excelsior, an English seedling Japanese, with flowers of a purplish-rose; W. Tucker was again shown—it promises well; and G. C. Schwabe, a Japanese, with pale chestnut-coloured flowers, is a distinct addition—the height of the plant 3 to 4 feet.

Vase arrangements of Chrysanthemums by themselves, and others with mixed assortments of flowers, were an attractive feature. Mr. Booker, Mr. Frost, and Mr. Turton were 1st prize winners for Chrysanthemums, whilst in the other classes Miss Phillips and Mr. Abery, Tilehurst, were the most successful. Several classæ are provided at this show for mis-

cellaneous decorative plants in season, many well-grown examples being shown of such as Bouvardias, Primulas, table plants, and Orchids.

Fruit was shown well, and in abundance. For a collection of six dishes, Mr. Maxim, gr. at Uckfield Place, was a good 1st, with well-finished Grapes, a Melon, Durandean Pears, and King of the Pippin Apples. With six dishes of dessert Apples, Mr. Turton was 1st, with fruit of superior quality. For six culinary Apples, Mr. Irvine, gr. to H. Akroyd, Esq., Shiplake, was 1st, with extra fine fruit.

Pears were shown well. Mr. Turton winning with Doyenné du Comice, and Marie Louise, extra good; Mr. Maxim being 2nd. The latter exhibitor was also one of the most successful in the Grape classes. The finest Muscats, well coloured, and as well kept, were shown by Mr. Pound, gr. to Alfred Sutton, Esq., Greenlands.

SWANSEA AND DISTRICT.

NOVEMBER 11, 12.—The second annual exhibition of the Society was held in the Albert Hall, Swansea. The principal prize for forty-eight blooms was awarded to Sir Charles Phillips (gr., Mr. Dumble), for a fine collection, he being closely followed by Sir Henry Vivian (gr., Mr. Ireland).

In the class for thirty-six blooms, Mr. Dumble again took 1st place, being closely followed by Colonel Wright and Mr. Muir Margam, all showing remarkably well. For twenty-four blooms, Mr. Ireland was placed 1st, his incurved blooms being very good; Miss Talbot (gr., Mr. Milner) being 2nd. In the class for twelve Japanese, Mr. Milner was placed 1st; and for twelve incurved, distinct varieties, Mr. Ireland was 1st, with large, solid blooms.

For the best incurved blooms in the show, Mr. Dumble was 1st, with a magnificent bloom of Jeanne d'Arc; and the best Japanese blooms were found in the 1st prize stand of Miss Talbot, in a grand bloom of Avalanche.

Groups were well competed for, the 1st prize going to Sir Henry Vivian. For six specimen plants, distinct, Sir Henry Vivian was again 1st, and also in the class for three specimens, showing in each class well-grown plants.

Special.—The Silver Cup given by M. Evans, Esq., for the best six specimen plants of white Chrysanthemums was won by his own gardener, Mr. Hammond.

For black Grapes, A. Gilbertson, Esq., was placed 1st; and Sir Henry Vivian took 1st for good bunches of Muscat of Alexandria.

Vegetables were also well shown.

BOURNEMOUTH.

NOVEMBER 11, 12.—The Bournemouth and District Chrysanthemum Society held its annual exhibition at the Hotel Mont Doré Winter Gardens on the above-mentioned dates.

Groups made a grand display, the 1st prize being taken by Messrs. G. Watts & Sons, Bournemouth; Mr. T. H. Crisp, gr. to Lord Wimborne, Canford Manor, Wimborne, and Mr. T. K. Ingram, Parkstone and Bournemouth, were placed equal 2nd, for capitally-grown and well-arranged plants. Other groups were good.

Cut Blooms.—These were well shown, the chief prize going to Mr. Garner, gr. to Mrs. Braddyll, Amberwood, Christchurch. Mr. G. W. Taylor, gr. to T. P. Elphinstone, Esq., Christchurch, had the best stand of twelve Japanese distinct; and Mr. Garner had the best stand of incurved. Messrs. D. Stewart & Sons, Bournemouth, staged the best twelve blooms of reflex varieties, and Mr. C. Phillips, gr. to T. J. Hankinson, Esq., Bournemouth, had the best stand of Anemones.

Fruit and vegetables were plentifully shown in good condition.

EDINBURGH BOTANICAL.

NOVEMBER 12.—The first meeting of this Society was held at 5, St. Andrew Square; Mr. Lindsay, the retiring President, occupied the chair. A large spadix of *Ptychosperma elegans*, with ripe fruit from a tree over 50 feet high, was exhibited from the Royal Botanic Garden, from which were also shown a collection of New Zealand Veronicas, a large plant of *Saxifraga longifolia vera*, &c. Mr. Campbell, Ledaig, sent flowers of *Escallonia macrantha*, *Veronica speciosa* var., and *Passiflora Constance* Elliott from the open air.

Mr. Lindsay, in his presidential address, dealt with "New Zealand Veronicas," giving a short

description of those species at present in cultivation, and describing the various uses to which they are best adapted for garden purposes. He divided them into three groups, hardy, half-hardy, and tender. All the species found in a wild state at altitudes above 3000 feet proved to be thoroughly hardy in cultivation. Those species found at altitudes below 2500 feet to 1000 feet were found to be half-hardy; the tender species came chiefly from districts near the sea coast. There are over sixty species natives of New Zealand, forty of which are at present in cultivation in the Royal Botanic Garden, Edinburgh. Mr. Lindsay pointed out how good results might be obtained by selection, and by hybridising the tender with the hardy species; and in concluding, indicated that there were several very fine species not yet introduced that would be great ornaments to our gardens, particularly *Veronica macrantha* and *V. Benthamii*.

Mr. Thomas Jamieson, F.I.C., Fordyce Lecturer on Agriculture, Aberdeen University, read a paper on the "Structure and Function of Root-hairs." In the course of his researches into the question of the use and mode of absorption by plants of phosphorus, he had been led to examine the evidence for the generally-accepted doctrine that the wall of root-hairs is permeated by an acid which brings insoluble matter into solution for absorption into the root-hairs. He maintained that this acidity may be accounted by decomposition, and the dissolving action of the root-hair seems to be little more than an assumption rendered necessary as an explanation of the well-known fact that insoluble matter is assimilable by the plant. He then advanced the view that it is possible for solid particles to enter the root-hairs through the membrane of the hair, and he described the occurrence of a minute aperture he had discovered in the walls of root-hairs, through which particles he had found within the hair might have entered. The value of potash to roots would be explained by its facilitating the entrance of such solid particles, and similarly an explanation would be afforded of why crystalline particles are of less service than amorphous ones to root, and also of the fact that the degree of effectiveness of a phosphate corresponds with its state of division.

In the course of the discussion which ensued, Dr. Aitken doubted the possibility of accounting for the well-known acidity of roots by the loss of decomposition alone; and Professor Bayley Balfour stated several difficulties in the way of accepting the author's views, and pointed out the presence of the alleged aperture in the root-hairs might be proved or disproved by the differential staining of the inner and outer walls of the root-hairs.

Mr. Charles Howie noted a new station for *Epipactis latifolia* in the East of Fife.

Mr. Lindsay's Reports on Temperature and Vegetation in the Royal Botanic Garden, Edinburgh, during July, August, September, and October, 1891.—The month of July was, for the greater part, changeable and inclement. There was a very marked absence of real summer warmth. The lowest night temperature was 42°, which occurred on the 10th of the month, and the highest, 54°, on the 17th. The lowest day temperature was 63° on the 16th, and the highest, 79° on the 17th. Roses were unusually late, although late in commencing to flower. Herbaceous plants generally were also good. On the rock garden 252 species and well-marked varieties came into flower, as against 201 for the corresponding month last year. A few of the more interesting were:—*Aquilegia pyrenaica*, *Anomatheca cruenta*, *Astragalus alopecuroides*, *Calamittha patavina*, *Campanula Waldsteiniana*, *Dianthus neglectus*, *D. cyanobarbus*, *Cyananthus lobatus*, *Epilobium obcordatum*, *Eriogonum aureum*, *Gentiana septemfida*, *G. tibetica*, *Hypocnemis reptans*, *Gallium rubrum*, *Lunaria organifolia*, *Mimulus roseus*, *Palava flexuosa*, *Pentstemon speciosus*, *Potentilla lanuginosa*, *Saxifraga diversifolia*, *Senecio laxiflora*, *Swertia multicaulis*, *Veronica elliptica*, *V. Rakaiensis*, &c.

August was an exceedingly cold and wet month, no really warm days occurred, and altogether the month was a most unfavourable one. The lowest night temperature was 34°, which occurred on the 30th, and the highest 55°, on the 18th. The lowest day temperature was 59° on the 23rd, and the highest 77° on the 19th. Rain fell on twenty-three days. On the rock garden eighty-four species came into flower, as against eighty-one during last August. Amongst the most conspicuous were—*Cheiranthus Allioni*, *Carlina subcaulescens*, *Cyclamen hederifolium*, *Dalibarda repens*, *Dianthus Atkio-*

soni, *D. monspessulanus*, *Delphinium velutinum*, *Epilobium Fleischii*, *Gentiana arvernensis*, *Helleborus niger angustifolius*, *Lilium dalmaticum*, *L. auratum*, *Lobelia cardinalis*, *Mimulus cardinalis*, *Spiraea gigantea*, *Stobrea purpurea*, *Tricyrtis australis*, &c.

The month of September was very changeable and unsettled, with frequent storms of wind and rain, yet in some respects it was the best month of the season. More really fine and warm days occurred than in any of the three months previous. The severe storm of wind and rain which took place on the 21st, and which caused so much destruction throughout the country, passed over without doing any serious damage in the garden.

No frost occurred, and there was a fair amount of bright sunshine. Late-flowering herbaceous plants and annuals now reached their best; those which flowered earlier mostly produced good seed, a large supply of which have been obtained for distribution. The lowest night temperature was 38°, which occurred on the 21st of the month, and the highest 54°, on the 14th. The lowest day temperature was 49°, on the 21st; and the highest 58°, on the 12th. Rain fell on nineteen days.

On the rock garden, forty-one species came into flower, as against forty-seven for the corresponding month last year, amongst which were the following:—*Coreopsis verticillata*, *Gentiana alba*, *G. ornata*, *Gladiolus Saundersii*, *Crocus annulatus*, *C. imperati*, *C. pulchellus*, *C. speciosus*, *Colchicum maximum*, *Kniphofia uvaria*, *K. nobilis*, *Potentilla formosa*, *Senecio pulcher*, *Veronica Lindleyana*, *V. longifolia subsessilis*, *Lilium auratum macranthum*, &c.

The month of October was on the whole favourable. The first frost this season took place on the 18th of the month, when the glass registered 32°. The thermometer was at or below the freezing point on eight occasions, indicating collectively 20° of frost for the month. The lowest readings were on the 18th, 32°; 23rd, 32°; 25th, 27°; 29th, 26°; 30th, 29°; and 31st, 26°.

The lowest day reading was 45° on the 29th, and the highest 71° on the 5th. Dahlias and other tender plants were destroyed by frost on the 23rd. Deciduous trees and shrubs were late in shedding their leaves; autumn tints were most conspicuous on Scarlet and Hungarian Oaks, Tulip-tree, Beech, *Pavia flava*, *Amelanchier vulgaris*, *Azalea pontica*, and *Ampelopsis tricuspidata*. Amongst fruit-bearing trees or shrubs, the best set are, *Hollies*, *Cotoneasters*, and *Gaultherias*. Hardy *Rhododendrons* and *Azaleas* are fairly well set with flower-buds. On the rock-garden thirteen species came into flower during October as against twenty-three for October, 1890. Amongst those which flowered were *Crocus asturicus*, *C. Salzmanni*, *Erica ciliaris*, *Gentiana Kurrooa*, *Glycerium argenteum*, *Helleborus altifolius*, *Kniphofia Saundersii*, *Oxalis lobata*, *Saxifraga Fortunei*. The total number which have flowered since January 1, is 1210, during the same period last year 1154 had flowered.

Records of Temperature, Vegetation, &c., at the Botanic Garden, Glasgow, by Robert Bullen, Curator.—July, 1891.—This was the driest summer month experienced here since July, 1885, but the temperature was much higher this month. The readings on the shaded thermometer varied during the month from 63° to 76°, and on that in the sun from 75° to 101°. The lowest night temperature was 44°, and the highest 56°. Dull mornings were frequent, but generally followed by bright days—altogether a bright sunny month. Trees, shrubs, and various crops suffered much by lack of moisture, numerous *Pansies*, &c., died out in the open borders, but the various Californian annuals, and the usual assortment of bedding-out plants were very effective, the bright weather having brought out the natural brilliancy of their flowers. The lawns had a parched appearance.

August, 1891.—In striking contrast to last month, this was mostly cloudy and wet, the latter part unusually so, and the rains were often so heavy as to greatly discount the previous harvest prospects. At this time the prospect was further darkened by the rapid development of the Potato blight in many districts of the country, the meteorological conditions being highly favourable for its spread. Occasional bright days were recorded, and bright sunshine, but generally of short duration. The highest reading of the sun-thermometer was 90° on the 18th, but frequently the reading was below 80; the temperature in the shade was also low for the month. Half-hardy plants made good growth, and bloomed well until the stormy night of the 25th, which gave them a very tattered appearance.

September, 1891.—This was a rainy, stormy month, probably one of the wettest known in meteorological history. The storms and floods were most injurious to garden and farm crops of all descriptions, and over a large part of the country. In a few districts the harvest was fairly well gathered, but mostly the reverse was the case, and the Potato crop a comparative failure. Owing to the continued wet weather and immunity from frost, many hardy shrubs, both deciduous and evergreen, were still growing at the end of the month. *Rhododendron ponticum* and its progeny mostly made a second growth. All the tender, and some of the so-called hardy annuals, died an early death from cold and damp.

October, 1891.—A chilly, wet, and comparatively sunless month, the fine days recorded as such from beginning to end only count one week, the remainder being very unsettled. Floods and storms were frequent and severely felt; farm and garden land suffered much from the immense access of waters, apart from the crops that were either in or on the ground. It will make winter tillage on heavy land difficult. The only vegetation which has derived benefit by the deluge are those trees whose roots are deep. Grass continued to grow at the end of the month, and the fall of the leaf is this season much later than is usual here. A storm of great severity was experienced on the night of the 13th, leaving behind it much disaster. The day temperature was nearly normal, but the night temperature fell rapidly after the 22nd. The lowest reading was 6°, on the night of the 24th. Total frost, 17°, and thrice at freezing point.

ULSTER HORTICULTURAL.

NOVEMBER 12.—The third annual show in connection with this Society took place at Belfast on the above date in the new covered market, May Street. This show is devoted chiefly to *Chrysanthemums*, although the exhibits in fruit and vegetables and also flowers were very large. The entries this year were more than double those of the first show, and also a great improvement in quality.

The exhibition was opened by the Countess of Shaftesbury. The Mayor of Belfast (Mr. C. C. Connor), addressing the Countess of Shaftesbury, said the Ulster Horticultural Society had been established some little while ago for the purpose of encouraging the growth of flowers, fruit, and vegetables in Ulster. This was the first society of the kind established in the North of Ireland, and he was glad to say that its success hitherto had been very marked. They were particularly desirous of improving the quality of fruit, as it was apparent that in these days of depression in farming, fruit might prove a valuable source of profit to the producer.

The Mayor concluded by introducing Mr. Duon, gr. to the Duke of Buccleuch. Mr. Dunn then delivered a brief address on the cultivation of fruit.

WINCHESTER.

NOVEMBER 12, 13.—The Guildhall was the site chosen for the annual autumn exhibition in this ancient city, and it proved a great success.

In the class for the best arrangement of *Chrysanthemums* in a group, Mr. F. Smith, gr. to Lady E. Wodehouse, Mayfield, Winchester, occupied premier position; Mr. J. Wareham, gr. to Mrs. Gunner, Winchester, 2nd. Mr. E. Astridge, gr. to W. Barrow Simmonds, Esq., Abbots Barton, Winchester, had the best group of miscellaneous plants; and Mr. F. Moot, gr. to Mrs. C. Warren, Northlands, Winchester, was 2nd. Specimen *Chrysanthemum* plants were best shown by Mr. Kaines, Winchester.

Primulas were good at this show. Mr. G. Meldon, gr. to Miss Turner, Winchester, was an easy 1st. Table plants were well shown by Mr. J. Amis, gr. to the Hon. Mrs. Elliott York, Hamble Cliff, Netley.

Cut blooms were staged in fairly good numbers, and of excellent quality. For forty-eight in not less than thirty-six varieties, Messrs. W. & G. Drover, Fareham, secured 1st prize with well-finished blooms. Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester, was a creditable 2nd.

For twenty-four Japanese, Mr. Trinder, gr. to Sir H. Mildway, Bait., Dogmersfield Park, Winchester, was 1st; Mr. Neville, who staged smaller examples, being 2nd. In the class for twelve incurved distinct, Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rookesbury Park, Fareham, was 1st, with very neat blooms; Messrs. Drover were 2nd.

Mr. N. Molyneux was also 1st for twelve Japanese

and for twenty-four blooms any section. Mr. Budd, gr. to F. Dalgetty, Esq., Lockerby Hall, Romsey, and Mr. C. H. Holloway, gr. to F. W. C. Read, Esq., Down Grange, Basingstoke, took 2nd honours in the order given.

Two classes were confined to ladies only, namely, for the best-arranged stand of Chrysanthemums and other flowers, with foliage, grasses, &c.; and for another stand filled with cut hardy shrubs, Ferns, and grasses, grown out-of-doors. In the former, Miss Ladham won with a creditable display, Miss Nelly Owen, Basingstoke, being 2nd. In the latter class Miss Flight was an easy 1st, with a most effective arrangement; Miss Ladham being 2nd.

Fruit, although not large in quantity, was of excellent quality. For three distinct varieties of Grapes, Mr. Budd was 1st with good examples.

The best two bunches of black Grapes came from Mr. J. Gardner, gr. to Colonel Stratton Bates, Twyford.

White Grapes were moderately well shown by Mr. F. Farwell, gr. to F. Bowker, Esq., sen., Larkhills, Winchester.

Mr. Ams had the best three dishes of dessert Apples. Mr. Best, gr. to C. W. Chute, Esq., The Wyne, Basingstoke, had the best kitchen varieties; also the best vegetables in a strong entry.

Mr. Hillier, Winchester, staged, not for competition, three dozen dishes of Apples, leading varieties—good fruit.

TEDDINGTON.

NOVEMBER 12, 13.—A very neat exhibition was that held in the Town Hall, Teddington, on the above dates. Generally the classes were well filled, and the average quality for the class of show excellent. Only one group of a miscellaneous nature, Mr. Gregory, gr. to F. Weymouth, Esq., Teddington, being the exhibitor, was arranged. It was a very pretty one, set up with some small Orchids, Primulas, Cyclamens, and excellently coloured foliage plants.

Of Chrysanthemum plant groups, the best was placed by Mr. Mitchell, gr. to W. Cunard, Esq., Twickenham; Mr. Osborn, gr. to Mrs. Howard, Teddington Grove, was 2nd. Mr. Sallows, gr. to Miss Vaughan, Twickenham, had the best three trained plants in two classes. Chinese Primulas table plants, &c., were very good.

The Challenge Vase offered for twelve Japanese blooms and twelve incurved flowers, was won by Mr. Coombs, gr. to W. Furze, Esq., Teddington, who, having won it the previous year, now becomes its absolute owner. Mr. Higginson, gr. to General Vials, was 2nd. Mr. Coombs was also 1st with twenty incurved blooms, and the same for twenty Japanese; Mr. Davis, gr. to J. P. Chappell, Esq., Teddington, was 2nd. For twelve incurved blooms in the open class, Mr. Slade, gr. to Lady Bowater, Richmond Park, was 1st; Mr. Higginson being 2nd. Mr. Slade also had the best twelve Japanese; Mr. Osborne 2nd.

Mr. Coombs had the best twelve reflexed, and Mr. Clarke, gr. to A. Nagle, Esq., Surbiton, had the best twelve bunches of Pompons, and also of Anemone Pompons, all capital flowers.

In the open class, the best six incurved of one variety were from Mr. Coombs, very good Queen of England; Violet Tomlin, from Mr. Slade, being 2nd.

In the duplicate Japanese class, the best was Etoile de Lyon, very fine flowers, also from Mr. Coombs; Mr. Davis being 2nd with Madame C. Audiguier.

Numerous local and amateurs' classes were well filled.

Fruit was plentiful. The best collection of three dishes of good black Grapes, Apples, and Pears, came from Mr. Rickwood, gr. to Lady Freake, Fulwell. The best white Grapes, capital Muscat of Alexandria, were from Mr. Mitchell; and Mr. W. Tubbs, had the best black, in very good Gros Maroc.

Miss Pout, Teddington, had the best two dishes of Pears in Beurré Diel and B. Bachelier. Mr. Smith, gr. to H. D. Phillips, Esq., Hampton Wick, the best couple of dishes of dessert Apples, in Ribston and Cox's Orange Pippins, as also for the best kitchen kinds in Blenheim Pippin, and Mère de Ménage.

Mr. Stroud, the Police Orphanage, Twickenham, had the best collection of vegetables; Mr. Garrod, Twickenham, being a very hard 2nd.

There were numerous epergnes, &c., shown by ladies, and Mr. Tracy, of Twickenham, had a pretty group of Orchids. Mr. W. Taylor, Hampton, Mr. Woodward, Teddington, and Mr. Latham, Hampton Court, had excellent collections of fruits.

WIMBLEDON AND DISTRICT.

NOVEMBER 12, 13.—The usual autumn show of this Society was held in the capacious Drill Hall at Wimbledon on the above dates. The competitions were in some cases few, in others very good. On the whole, the show was smaller than should be found in this wealthy and populous district, and some effort should be made to infuse into it greater vitality.

A fine group of plants was arranged by Messrs. Thompson & Sons. The large-group class brought only two exhibits, Mr. Newell, gr. to Sir E. Saunders, Wimbledon, having a very pleasing arrangement. Of smaller groups, Mr. G. Harman, gr. to J. Macfarlane, Esq., Wimbledon, was 1st. Mr. Newell had the best basket of plants—one, about 4 feet across, very well arranged, and bright in the bloom.

In the Chrysanthemum groups of the larger class, only one, and from Mr. F. Chandler, gr. to Canon Haygarth, Wimbledon, was staged—a very telling collection, with very fair blooms; this took the Tradesman's Silver Cup. Of smaller ones, Mr. Day, gr. to H. C. Turle, Esq., had the best. Trained plants were few, and call for no mention.

Chinese Primulas were very good. Mr. Newell had the best six plants, there being good variety of colour in the flowers.

Table plants were very good. A capital half-dozen were staged by Mr. Wilkins, gr. to J. M. Pearson, Esq., Kingston Hill. Mr. Newell had the best six berried plants in neat standards of Prince of Wales Capsicum.

Cut flowers were generally very good. The Challenge Vase for twenty-four Japanese and twenty-four incurved, won last year by Mr. Mease, gr. to A. Tate, Esq., Downwell, Leatherhead, brought three competitors. Mr. Mease was again the winner, with a really beautiful lot of blooms, beating Mr. Carpenter, who had won the Challenge Cup at Kingston on the 10th, and Mr. Gibson, Morden Park, who came 2nd and 3rd.

With twelve incurved and twelve Japanese, Mr. Mease was again a good 1st; Mr. C. N. Knowles, gr. to Mrs. Egerton, Rushampton, coming 2nd; and Mr. Alderman, gr. to Gilliat Hatfield, Esq., Morden Hill, was 3rd. Mr. Mease was also 1st in the class for twelve incurved and twelve Japanese blooms.

Mr. Hendon, gr. to D. B. Bressford, Esq., had the best six incurved; and Mr. Bradford, gr. to W. H. Hall, Esq., Wimbledon, was 2nd. Mr. Potbury, gr. to W. H. Froy, Esq., Putney Hill, had the best six Japanese, and Mr. Alderman the best twelve bunches of Pompons.

Of fruit, Mr. Griffin, gr. to the Misses Christy, Coombe Bank, had the best black Grapes in fine Alicante, and the best whites in Muscat of Alexandria, superbly finished. Beurré Diel, Gansell's Bergamot, and Duchesse d'Angoulême, from Mr. Lysell, were the best Pears.

Mr. Alderman had three dishes of Apples in Peasgood's Nonsuch, really grand samples; Wellington, wonderfully fine; and Blenheim Pippin. Mr. Thornton was 2nd with three dishes of King of the Pippins, all remarkably fine, handsome examples. Mr. Alderman also showed a large collection of good Apples, as also did Messrs. Reed & Sons, Tulse Hill.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT.

NOVEMBER 12, 13.—This young society held their second exhibition of Chrysanthemums, fruit, and vegetables in the Town Hall, Ware. The prize competition is solely confined to members only of the society. Classes are set apart for gardeners, amateurs, and cottagers.

The principal prize-winners in the gardeners' class for a collection of Chrysanthemums were, 1st, Mr. G. Fulford; 2nd, Mr. G. Collins. For a group of miscellaneous plants, Mr. Fulford secured 1st honours. In the cut-bloom section, Mr. C. Cox, of Brickenden Grange, was 1st with excellent blooms; 2nd, Mr. G. Fulford; 3rd, Mr. J. Turk. In smaller classes honours fell to Messrs. Fulford, J. Turk, D. Dover, G. Collins, J. Walters, and R. Smith.

Fruits and vegetables were well shown.

DEVON AND EXETER.

NOVEMBER 13.—This exhibition was held at Exeter, in the Victoria Hall, on Friday. Cut blooms were the special feature, and showed great improvement in the incurved classes. The groups of Chrysanthemums were pretty, but displayed not

the usual cultural skill. The groups of miscellaneous plants brought Mr. Rowland again to the front.

Fruit was very plentiful, and of good colour and quality, though perhaps, on the whole, not so fine as usual, probably owing to the fact that fruit does not keep well this season. Want of space precludes giving a detailed account.

HITCHIN DISTRICT CHRYSANTHEMUM SHOW.

NOVEMBER 13.—This exhibition took place in the Corn Exchange on the above date, and the exhibits were of a high-class nature. The arrangements of the Society were under the direction of Mr. W. C. P. Clark, of Hitchin, a most indefatigable Secretary, and a successful exhibitor of the Chrysanthemum.

In addition to the money prizes, a Silver Medal was offered for the best eighteen blooms, distinct, and a Bronze Medal for the 2nd. Mr. Clark gained the Silver Medal, with some clean and even blooms; and Dr. O. H. Foster, Hitchin, carried off the Bronze Medal.

The principal prize in the show, however, was offered for forty-eight blooms. Mr. J. Kipling, gr. to Mrs. Osgood, Rushworth Park, won the 1st prize with a magnificent stand; the 2nd prize-winner, Mr. A. Honett, gr. to G. B. Hudson, Esq., also staged some good specimens; Mr. John Anning, gr. to Captain Priogle, was a good 3rd.

For trained specimens, Mr. Springham, gr. to J. H. Tucke, was 1st; Mr. James Upland, gr. to F. Lucas, Esq., 2nd; followed by Mr. W. Millard, gr. to Wm. Ransome, Esq.

For bush plants, Mr. G. Harwood, gr. to A. Ransome, Esq., Hitchin; and Mr. E. Butler, gr. to F. Seebohn, Esq., were 1st and 2nd respectively; Mr. Springham was 3rd.

In the class for six incurved blooms, one variety, Mr. Honett was 1st, with Queen of England; Mr. Sharp, gr. to R. P. Wilson, Esq., Hitchin, 2nd; and Mr. J. Anning 3rd.

For six white Japanese, Mr. Honett was also 1st, and a First-class Certificate of the National Chrysanthemum Society was awarded him. Mr. Sharp was 2nd, and Mr. E. Cotton, gr. to A. W. Lines, Esq., Hitchin, 3rd. Messrs. Honett and Sharp were also 1st and 2nd for coloured Japanese.

The Pompons were not up to the average. Mr. G. Moules, Hitchin, took 1st prize in this class.

The Secretary (Mr. Clark) was the most successful exhibitor of three incurved and three Japanese, the 2nd and 3rd being taken by Mr. E. Ossman and Mr. G. Sanders. Mr. Clark's stand was deservedly awarded a First-class Certificate of the National Chrysanthemum Society, and one of his incurves, Empress of India, being the premier bloom in the show.

The groups were above preceding years in point of quality, the prizes falling to Mr. E. Ossman, J. Upschurd, E. B. Lindsell, Esq., Bearton, Hitchin; and Mr. R. Sharp.

COLONIAL NOTES.

JAMAICA.

The last Bulletin issued by the Botanical Department contains an article on a disease in Coconuts, presumably caused by bacteria. Mr. Jenman continues his synoptical list of Jamaica Ferns.

LAHORE.

The garden under the charge of Mr. Hein suffered much from the effects of the wet season, according to the Report for the year ending March 31, 1891. Chrysanthemums and Orchids did well, and the seedling Dates from Tunis and the Persian Gulf are thriving, but of very slow growth.

OODEYPORE.

Mr. Storey's annual report of the garden under his charge for 1890-91 is a satisfactory record of progress. Eight months' dry weather are very trying to vegetation, and in conjunction with the porous character of the soil, necessitate much care in watering and irrigation. Much damage was done by frost. Cut flowers are in large demand for the festivities given by the Maharana. A handsome library and museum have been inaugurated, and a

new rock garden, accommodating nearly 6000 sorts of plants, has been constructed.

DEMERARA.

Mr. Jenman reports that Gambier (*Uccaria gambier*), which furnishes a very valuable tanning substance, has been introduced from Kew. Cuttings of lateral shoots, remarks Mr. Watson, although they produce roots, grow horizontally, and will not form leaders. The plant may, however, be propagated by cuttings. Dr. Goebel, of Marburgh, made a prolonged stay in the gardens for the purpose of studying the Podostemaceæ. The reporter is evidently enamoured of fractions, for he records that the monthly average of carriages entering the garden is $66\frac{3}{12}$, and the daily average $21\frac{300}{365}$. At Berbice during the year 85 inches of rain fell, the largest quantity (16·6 inches) in January; the smallest (1·04) in October.

A PRIMULA DISEASE.

Mr. C. W. Dod exhibited at the Scientific Committee of the Royal Horticultural Society, on October 6, specimens of *Primula rosea* attacked by mildew. These were subsequently sent to Kew for investigation.

The disease is caused by a minute fungus belonging to the genus *Ramularia*, which appears on both surfaces of the leaf, especially towards the base, under the form of small ochraceous patches, which soon spread and run into one another, forming a more or less continuous cloud-like bloom on the surface, that becomes more conspicuous when the white spores or reproductive bodies are mature. As is the case with almost every fungous disease, when the fungus makes its appearance on the surface in the "mildew" form, for the purpose of forming its fruit, the work of destruction is practically done, being caused by the mycelium, which, during its vegetative phase, remains concealed in the tissues of the leaf. During this first period there is often but little evidence of its existence, the blotching or scorched appearance resulting from the death and collapse of the cells of the leaf, that have had their contents exhausted by the parasite. As in the higher forms of plant-life, these minute fungi have their characteristic features during the vegetative phase of development, in some kinds when a germinating spore sends its germ tube into the tissue of a leaf, the resulting mycelium remains localised or concentrated within a small area, eventually indicated by a small discoloured spot; in others, the mycelium spreads throughout the greater portion of the leaf, often travelling between the cells, and giving off branches that enter the cells by dissolving the wall at the point of contact, and feeding on the contents, after which the cells collapse, the walls generally becoming brown or blackish. In some instances the mycelium, when once in the tissues, travels from one leaf to another. The Hop mildew illustrates the habit of another group where the mycelium is external, forming a more or less compact, felt-like, white film on the surface of the leaf, and giving off numerous short branches or "haustoria," that pierce the cells, and absorb their contents as food.

In the *Primula* mildew, the mycelium is internal and at maturity sends out into the air numerous tufts of almost colourless, unbranched, upright threads, each bearing a single narrowly spindle-shaped spore at its tip, as shown in the accompanying illustration (fig. 87).

At the moment of maturity, the spores germinate readily within twelve hours when placed in water. This condition of things also takes place in a state of Nature: if we imagine a single patch of the mildew on a *Primula* leaf, which at maturity produces a hundred spores—a number very much within the mark—and each of these spores being conveyed by rain, wind, &c., to another leaf, or another portion of the same leaf, to produce within a few days a similar patch, it can be readily understood how a fungus disease spreads. And this is actually what takes place in scores of fungoid diseases, so long as the required amount of temperature and moisture

is present; when these conditions fail, the fungus-spores remain dormant until the return of favourable conditions. In the case of perennial plants, the fungus mycelium often remains dormant in the tissues during the winter, resuming activity with the development of new leaves.

Repeated experiments proved that the spores would not germinate in water containing 1 per cent. of a saturated solution of sulphate of copper. This is also true of the spores of many other species of fungus pests, in fact of all that I have had an opportunity of experimenting upon; hence it would appear that the copper salt is the most effective constituent in the various fungicides, as Bordeaux Mixture, &c. All that can be expected, or at all events all that will ever be got from the use of the various solutions, sulphur, and lime powdering, &c., is the temporary check of the pest, but this is in some instances worth the trouble. None of the above-mentioned applications benefit any healthy plant, and in the case of a diseased one, all that is accomplished is the partial retardation of spore formation, and the consequent spread of the disease; the myce-

FIG. 87.—A SPORE-BEARING TUFT OF THE PRIMROSE MILDREW, *RAMULARIA PRIMULE*, THÜM. MAGNIFIED 400 TIMES.

lium in the tissues is not destroyed, and as spore formation, as already stated, is almost continuous throughout the season, the repeated application necessary to kill the successive crops of spores would in most cases act injuriously on the delicate portion of the plant.

Notwithstanding the above, the matter of fungoid diseases is not hopeless, and the first essential towards a successful issue is a thorough knowledge of the life-history of the various parasites; with this knowledge at hand, the weak point in the life-cycle of the pest could be attacked.

As the species is new to the British Fungus-flora, a description is appended. It has been met with in Italy, Austria, and Siberia, parasitic on *Primula acaulis*, *P. officinalis*, and *P. macrocalyx*.

Ramularia primula, Thüm.—Spots ochraceous, circular, or irregularly angular, tufts of hyphae occurring on both surfaces of the leaf; hyphae 50 to 70 by 5 to 6 m., continuous, minutely denticulate towards the apex, rarely branched; conidia cylindrical-fusoid, 1-septate, colourless, 20 to 30 by 5 to 6 m. On leaves of *Primula rosea*, G. Massee.

SCOTLAND.

NORTH OF SCOTLAND ROOT, FRUIT, AND VEGETABLE ASSOCIATION.

THE annual show of the above was held at Inverurie, N.B., on Saturday, the 7th inst., in the Volunteer Hall, and was attended with the usual success. The association has all along aimed at being wide in its scope, the farmer, gardener, and amateur in the district having to compete against all comers; but despite the fact that growers of special articles might beat solitary districts in detail, the plan has been found to work well, and the success of the association has, no doubt, in a large measure been owing to this departure from the ordinary custom.

The entries this year were 608 as against 650 in 1890, therefore a slight falling off is indicated. Garden produce was tastefully staged, and the plants on the tables served to enhance the appearance of the exhibits. The Potatoes were of fine appearance, and of excellent quality. The finest Potato in the hall was Sutton's Seedling, shown by Mr. G. Macpherson, Cluny, in the class for any new variety now in commerce. They were, however, disqualified, because, as alleged, they are now out of commerce. Garden Turnips, although of good quality, were not numerous. Of Leeks there was an extraordinary display, nothing finer having ever been shown here. Beet was also good. The best collection of vegetables was shown by Mr. John Ogston, Bourtie. Complaints of disease in Potatoes are heard all over the country, but notwithstanding this fact, the display of Potatoes was a large one, and the quality excellent. Among varieties that appeared to have suffered little from disease over the country, are the Magnum Bonums and the Bruce, but the Champions, which were at one time considered all but disease-proof, have in some instances suffered considerably.

In the classes of seedling Potatoes, Messrs. Cocker & Son, Aberdeen, and J. Macpherson, Elgin, carried off the leading honours.

The display of fruit, considering the rainy summer, was well up to the average of former years, Apples in particular. A splendid lot of well-matured culinary Apples were shown by gardeners and amateurs. Mr. Murray, Fauchaulds, led with green-top Swedes, and Sir Robert Abercromby, Bart., in a large class of purple-top Swedes, of good size and quality, which were awarded the Silver Cup for the best lot of Swedes. This is the fourth time in succession that Sir R. Abercromby has taken this prize, a sufficient testimony to the excellence of the seed, and the mode of cultivation pursued. If the Swedes were good, they were excelled by the green and purple-top yellows. The field Potatoes were a fine show. There was a good show of collections of thirty-six Potatoes, Mr. George F. Barron, Meikle Endovie, took the 1st place in this section, as he did two years ago. The varieties were Lord Rosebery, Grampians, Fortyfold, Sutton's Abundance, Magnum Bonums, and Glenberries.

THE DINNER.

The dinner was held in the hall of the Gordon Arms Hotel, Mrs. Mann, as usual, providing an excellent repast. The chair was occupied by Mr. A. M. Gordon, of Newton, Vice-President of the Association. The proceedings passed off successfully.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

HOW TO LAY OUT A MAZE.—Will any correspondent furnish particulars, the area required, that is, the extreme length and breadth of space requisite for a maze formed with Yew or evergreen hedges, stating the most suitable evergreen, the width, number of walks, &c.?
—C.

GLASS TUBES.—Where can I obtain, by the gross, small glass tubes, without any fittings, for button-hole flowers? L. [Advertisers, please note. Ed.]

VARIORUM.

THE PRODUCTION OF ARRACK IN SIAM.—The distillation of arrack from Rice is extensively carried on in the Chiangmai district, Siam. The Acting Vice-Consul reports that in this district, as well as in Lampun and Phrè, the distillation is a monopoly in the hands of the Chinese. In Chiangmai this monopoly is shortly to pass to a Chinaman under British protection, who is to pay 25,000 rupees (£1875) per annum for it. In Lakhon, every household is allowed to make its own arrack, but a liquor-tax of 1 rupee (1s. 6d.) per house is levied whether the liquor is distilled or not, a mode of collecting revenue which increases, rather than checks, the consumption of liquor. In Nan, on restriction is placed on the manufacture and sale of arrack, and the people of that province consequently enjoy an unenviable reputation for insobriety. The stills used are of a very primitive description. The fermented Rice is boiled in a deep iron pan set in brickwork, with a furnace beneath it, and over the pan is placed a large wooden cylinder, which receives the vapour. On the top of this cylinder is placed an iron pan containing cold water, and the liquor which is condensed by this runs off through a funnel, the end of which passes through the side of the wooden cylinder into jars. A great deal of firewood is consumed, and much of the spirit escapes in the process, and it would probably pay the liquor farmers well to import stills of foreign manufacture. In the provinces where there is a monopoly, besides the principal distillery, there are other small ones in the villages where liquor is distilled by Chinese holding sub-permits from the monopolist.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

12	2 -	40	0	- 46	+ 40	10	+ 164	30.9	27	47

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending November 14, is furnished from the Meteorological Office:—

"The weather during this period was very unsettled, and rough generally. Rain was very frequent, and the amounts were large in nearly all places.

"The temperature was a little above the mean in 'Scotland, N. and E.,' and about equal to the mean in 'England, S.W.' In all other districts it was rather below the normal. The highest of the maxima were recorded at most stations, either on the 10th or 11th, and ranged from 58° in 'England, S.,' and 57° in the 'Channel Islands,' to between 50° and 52° over the extreme N.W. and N. parts of the Kingdom. The lowest of the minima, generally speaking, were registered on the first day of the period, when they ranged from 24° in the 'Midland Counties,' 27° or 28° in 'Ireland,' 28° in 'England, E.,' and 29° in 'Scotland, N.,' to 33° in 'Scotland, W.,' 'England, N.W.,' and the 'Channel Islands.'

"The rainfall was more than the mean in all districts, the excess in most instances being very considerable. In 'England, S.,' the fall has been three times the normal, and in several other districts about twice as much.

"The bright sunshine showed a slight increase in most districts on that reported last week, but was still very deficient. The percentage of the possible duration ranged from between 8 to 12 in the west and extreme north of Great Britain, to 26 in England, E., and 27 in the Channel Islands.

MARKETS.

COVENT GARDEN, November 19.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Business quiet. English supplies of goods falling short. Large arrivals of Canadian and Nova Scotian Apples to hand, in good condition. The first cargo of new season's St. Michael's Pines landed this week in good condition. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Apples, ½-sieve	... 1 0-4 0	Lemons, per case	... 15 0-30 0

POTATOS.

Since last report the tendency has been an advance for best quality. Inferior samples and qualities are lower. Arrivals, a slight increase. J. B. Thomas.

SEEDS.

LONDON, Nov. 18.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that a stronger feeling prevails for red Clover seed; American seed, in particular, shows substantial advance. Choice yearling French Clover seeds also meet with considerable favour. Winter Tares are now neglected. For Rye, more money is asked. Blue Peas are held for full rates. The excitement over Canary seed has somewhat abated. For the new Russian Hemp seed, which has just come to hand, there is a good sale. Mustard and Rape seed keep firm. In Linseed there is no alteration.

FRUITS AND VEGETABLES.

SPITALFIELDS: Nov. 17.—Quotations:—English Apples, 2s. 6d. to 6s. per bushel; American do., 12s. to 22s. 6d. per barrel; Pears, 1s. 6d. to 2s. 6d. per half-sieve; English Tomatos, 5s. to 7s. 6d. per peck; foreign do., 1s. to 1s. 6d. per box; Sea-kales, 1s. to 1s. 6d. per punnet; Cabbages, 1s. to 2s. 6d., and Savoys, 1s. 6d. to 2s. 6d. per tally; Greens, 1s. to 1s. 6d.; Turnips, 2s. to 2s. 3d.; Carrots, 2s. to 2s. 6d.; Parsley, 1s. to 1s. 6d.; Beetroot, 2s. to 2s. 6d. per dozen bunches; Spinach, 1s. to 2s. per bushel; Parsnips, 4d. to 8d., per score; Cos Lettuce, 4d. to 8d. do.; Endive, 1s. to 1s. 6d. per dozen; Cabbage Lettuce, 3d. to 6d. do.; Leeks, 1s. 6d. to 3s. 6d. do.; frame Cucumbers, 1s. 6d. to 2s. do.; Mustard and Cress, 1s. 6d. to 2s. 6d. per dozen baskets; Belgian Onions, 3s. 6d. to 4s.; Dutch do., 3s. 3d. to 4s. 3d. per bag of 110 lb.; Celery, 6d. to 1s. per bundle; Horseradish, 1s. to 1s. 1d. do.

BOROUGH: Nov. 17.—Quotations:—Cabbages, 2s. 6d. to 4s. per tally; Savoys, 2s. 6d. to 5s. do.; Broccoli, 4s. to 6s. do.; Spinach, 1s. 6d. to 2s. 6d. per bush; Turnips, 1s. to 1s. 6d. per dozen bunches; Carrots, 1s. to 1s. 9d. do.; English Onions, 4s. 6d. to 5s. per cwt.; English Apples, 2s. to 3s. per bushel; Pears, 2s. 6d. to 7s. do.; Canadian Apples, 12s. to 25s. per barrel; and Newtown Pippins, 20s. to 50s. do.

STRATFORD: Nov. 18.—There was a good supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 2s. to 3s. per tally; Savoys, 3s. to 5s. 6d. do.; Greens, 6s. 3d. to 7s. 6d. per tally; do., 1s. 3d. to 1s. 9d. per bunch; Cauliflowers, 9d. to 1s. 3d. per dozen; do., 3s. 6d. to 4s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 35s. to 45s. do.; do., cattle-feeding, 25s. to 32s. do.; Parsnips, 10s. to 1s. 4d. per score; Mangels, 15s. to 18s. per ton; Swedes, 20s. to 25s. do.; Onions, English, 100s. to 120s. do.; do., Dutch, 3s. 6d. to 4s. 6d. per bag; do., Oporto, 6s. to 8s. per case; Apples, English, 2s. to 40s. per bushel; do., American, 14s. to 20s. per barrel; Sprouts, 1s. to 1s. 6d. per half-sieve; do., 2s. 3d. to 3s. per sieve; Horseradish, 1s. to 1s. 6d. per bundle; Celery, 6d. to 1s. 2d. per roll.

POTATOS.

SPITALFIELDS: Nov. 17.—Quotations:—Magnums, 65s. to 80s. per ton; Regents, 60s. to 70s.; Champions, 60s. to 65s.; Imperators, 65s. to 85s.; Hebrons, 60s. to 80s. per ton.

BOROUGH: Nov. 17.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 85s.; Bruces and Magnums, 60s. to 90s. per ton.

STRATFORD: Nov. 18.—Quotations:—Magnums, 65s. to 85s.; Imperators, 65s. to 85s.; Elephants, 65s. to 75s.; Hebrons, 65s. to 85s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Nov. 14, and for the corresponding period in the previous year:—1891, Wheat, 37s. 2d.; Barley, 30s. 11d.; Oats, 21s. 4d. 1890, Wheat, 32s. 8d.; Barley, 29s. 3d.; Oats, 17s. 6d. Difference: Wheat, +1s. 6d.; Barley, +1s. 8d.; Oats, +3s. 10d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; do., inferior, 40s. to 75s.; hay, best, 60s. to 92s.; do., inferior, 26s. to 50s.; and straw, 20s. to 40s. per load.

NOTICES TO CORRESPONDENTS.

ADIANTUM: Gilbert. Too much water, too much heat, not sufficient air: these are the probable causes of the mischief.

BOOKS: S. The Epitome of Gardening (Black & Co.), or Cassell's Dictionary of Gardening (Cassell & Co.). Gilbert. Molyneux on the Chrysanthemum (Journal of Horticulture Office, 171, Fleet Street).

BOTANIC GARDENS, CALCUTTA: Mounier. Apply to the Superintendent at Calcutta.

BIRMINGHAM: A. C. M. We cannot help you; consult some local authority.

CENTPEDES: S. J. B. and A. L. Try a dressing of gas-lime, one part to four of soil. Cut slices of Carrot, and lay them about or bury them beneath

the surface, and examine them every day. You may trap numbers in this way.

CHRYSANTHEMUMS: C. H. H. Good average blooms, but there are many of the same colour equally good, and the small hairs on the flowers are not sufficiently striking to be of importance.

CISTEN: G. S. The plants you name would not injure the water for the purposes you mention, but they might get in your way. Nymphæas, Limnæcharis, Sagittaria, Eichornia, Pontederia, &c. In your case these plants should be grown in large pots or tubs, and sunk a little below the level of the water.

CORRECTION: In the class for forty-eight cut blooms of Chrysanthemum at the Crystal Palace, Mr. Whittle, gr. to C. H. Gooschen, Esq., was placed 2nd, and Mr. Shoemith 4th, not 2nd as printed.

DISEASED MUSHROOMS: Correspondent. The Mushrooms are badly attacked by a well-known pest, a minute fungus, Mycogone rosea of Link. The only thing to do, is to get completely rid of the entire material composing the Mushroom-bed, as it is undoubtedly saturated with spores and spawn of the pest. G. M.

FUNGUS ON PEACH STEM: A. B. The fungus on the stem is Stereum purpureum; that on the root is spawn of the same. It has not been proved that the present fungus is the cause of disease, but it is amongst the commonest to appear on diseased woody plants. G. M.

MAGDALEN LILY: G. B. R. If you allude to this season, it is probably the L. longiflorum; if in summer, L. candidum.

MILDEW ON ROSES: Rev. A. P. Yes, certainly; but try it on a small scale first to find out the right strength to employ. Begin with a weak solution and increase the strength as may be necessary.

NAMES OF FRUITS: C. D. Hereford. 1 and 8, Glout Morceau; 4 and 5, Beurré Rance; 12, Winter Crassane.—R. F. P. 1, quite rotten; 2, Vicar of Winkfield.—A. B. Figue de Naples.—W. Rolfe, 1, Golden Reinette; 2, Cox's Orange; 3, Adam's Pearmain; 4, Doyenné du Comice; 5, Josephine de Malines; 6, Court Pendu Plat.—N. W. 1 and 3, Beurré Diel; 2, Beurré Rance; 5, Glout Morceau; 6, Passe Colmar; 7, Brown Beurré.—H. T. 1, Ecklinville Seedling; 2, Beauty of Kent; 4, Pea-good's Nonsuch; 5, Boston Russet; 6, Seckle.

NAMES OF PLANTS: Answer. Our time is too precious to waste in the attempt to name such miserable scraps.—J. E. McD. Linaria Cymbalaria.—J. D. 1, Juniperus chinensis; 2, probably Rhododendron ferrugineum.—G. J. 1, tree, one of the evergreen Oaks, probably a hybrid between the Cork Oak and some other; 2, Blue flower, Agatheæ celestia.—R. S. 1, Codium undulatum; 3, C. pictum; 4, C. majesticum; 5, C. angustifolium var. acubifolium; 6, C. angustifolium. All may be picked from one bush.—J. R. 1, Dendrobium chrysanthum; 2, Aspidium frondosum; 3, Aspidium (Nepbrodium) Molle.—E. C. Oncidium obryatum.—G. F. G. Senecio Ghiesbreghtiana.—A. W. Panicum capillare.

NOTICE TO LEAVE: Perplexed.—Assuming the facts to be as you narrate them, you have been very harshly treated. Consult a solicitor as to the law of the case.

PHALENOPIIS: J. M. The production of leaf-buds on the spike is not very uncommon.

POTATOS: Rev. A. P., Antrim. For many reasons it is better to change the ground, even though you afford manure. The ground may be swarming with fungus-spores, for one thing.

RATING OF GREENHOUSES: Bathonian. See Gardeners' Chronicle, March 9, 1889, p. 309. Greenhouses are trade fixtures. Land with greenhouses upon it used for commercial purposes, are market or nursery gardens within the Act. You should put yourself in communication with the Nursery and Seed Trade Association, 25, Old Jewry, E.C.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fute of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by

DUNCAN, FLOCKHART & CO., Chemists to the Queer, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

"Nothing Succeeds like Success."

CHRYSANTHEMUMS,
And How to Grow Them. By C. E. SHEA, Esq.

A Practical and Scientific Treatise, that will be of great service, both to the oldest and most successful exhibitor and the youngest grower of the Autumn Queen. Mr. Shea has, by the treatment explained in his treatise, had a long series of triumphs, to which this season he has added, in keen competition with our most noted growers, at the Kent County, Watford, and Crystal Palace, finishing with the difficult feat of 1st in the 48 Japanese, at the Royal Aquarium Show, Nov. 10.

In addition to the above, a paper by Mr. H. Shoosmith is included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world.

This valuable work is now ready, post free, seven stamps.
H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham.

HOLLOWAY'S OINTMENT and PILLS.—Counsel for the Delicate.—Those to whom seasons of changeable temperatures are protracted periods of trial, should seek the earliest opportunity of removing all obstacles to good health. This cooling Ointment, perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsey, relaxed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis, usually prevailing at this season, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment. The Ointment and Pills are highly commended for the facility with which they successfully conquer influenza: they allay in an incredibly short time the distressing fever and teasing cough.

Tuesday Next.

13,735 LILIUM AURATUM, being the whole consignment of 213 cases just to hand. The bulbs are in magnificent condition, and include 1025 EXTRA LARGE SELECTED ROOTS, Also 740 LILIUM SPECIOSUM ALBUM, and MELPOMONE; and 700 LILIUM KRAMERI.]

An immense collection of HARDY PLANTS and BULBS, consisting of thousands of NEW TULIPS, first-class varieties, DAFFODILS, CHIONODOXAS, and other BULBS, HOME-GROWN LILIES of the best kinds, CARNATIONS, PICOTEES, and PEONIES, 3000 Berlin Crowns LILY OF THE VALLEY, The new SPIRÆA COMPACTA MULTIFLORA, a large quantity of HARDY PERENNIALS, BEGONIAS, IRIS, and 180 lots of DUTCH BULBS.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, December 1, at half-past 11 o'clock.

On view morning of Sale, and Catalogues had.

MESSRS. PROTHEROE AND MORRIS will also SELL on FRIDAY, December 4, by order of Mr. F. Sander, some fine plants of the new variety of

CÆLOGYNE DAYANA GRANDIS, producing spikes of bloom 5 feet in length, THE GARLAND CÆLOGYNE, The plants are breaking freely.

It is evidently a free-growing variety. Collector writes:—"Nothing in Nature can exceed the elegance, grace, and beauty of this Orchid."

Wednesday Next.

AZALEAS, SPIRÆAS, ROSES, FERNS, and BULBS. MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, December 2, at half-past 11 o'clock, a SPLENDID CONSIGNMENT of PLANTS from BELGIUM, comprising 200 Azalea indica, including 50 Deutsche Perle, Azalea Mollis, 50 lots of Hardy Ghent Azaleas (double varieties), and 3000 Spiræa japonica, very fine clumps; 200 choice Palms, 40 lots of choice English-grown Greenhouse and Stove Ferns, Camellias, 2000 Lilyum Harrisii, Belladonna Lilies, Paper White and Poeticus Narcissus, Standard and Half-standard Roses, Home-grown Lilies, in great variety, Lily of the Valley, and a consignment of named Hyacinths and Tulips, for pots, glasses, and bedding; Crocus, Narcissus, and other Dutch Flower Roots from Holland—in all, 900 lots.

On view morning of Sale, and Catalogues had.

Friday Next, December 4.

THE OLD LABIATA.

ANOTHER GRAND IMPORTATION OF THE OLD AUTUMN-FLOWERING CATTLEYA LABIATA (LINDLEY).

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., by order of Mr. F. SANDER, on FRIDAY NEXT, December 4, at half-past 12 o'clock, over 1200 healthy plants of the

OLD LABIATA

from the only locality for the true old plant.

Re-imported by Mr. F. Sander.

It is the Queen of Cattleyas
It is warranted true
It is the easiest Cattleya grown
It is the freest-flowering Cattleya known
Its varieties are endless.

CATTLEYA LABIATA (Lindley).

Was discovered by W. Swainson in 1817, and since that year several small consignments have arrived in Europe. In about 1850, Mr. Horstall, of Liverpool, received some through a captain of one of his ships. Again, in about 1845, some plants came to Europe, and in 1882, Mr. Bartlett, of the Zoological Gardens, London, received a small consignment, and he disposed of it to Mr. B. S. Williams, of Upper Holloway, and two years ago a gentleman in Paris received an importation. The full history of the plant will shortly appear in the *Reichenbachia*. The old Labiata is a free-going Cattleya, and makes rapid growth, and is unequalled for cut flower purposes and grandeur of variety as a selling plant.

MESSRS. PROTHEROE AND MORRIS will SELL on FRIDAY, December 4, by order of Mr. F. Sander:—

CYPRIPEDIUM MONTANUM (INSIGNE).

Several widely different forms will be shown. Many grand and remarkable varieties have flowered among them.

Also a batch of INSIGNEs from the very spot whence came the incomparable SANDERIE.

Many fine plants of

DENDROBIUM RICHARDI, a fine introduction from New Guinea.

DENDROBIUM MACCARTHIE and D. AUREUM ZEYLANICUM.

Also a small importation of the rare

EPIDENDRUM RANDII.

This is extremely rare, and the plants now offered are GUARANTEED TRUE.

MESSRS. PROTHEROE AND MORRIS will also SELL on FRIDAY, December 4, by order of Mr. F. SANDER,

A GIANT CATTLEYA.

which is doubtless closely allied to C. Sanderiana although coming from an entirely new and far distant locality—on the confines of Venezuela and Columbia.

The plants are strong and every eye is sound and plump, and are sure to break freely.

Also many other rare, valuable, and useful orchids.

On view morning of Sale, and Catalogues had.

Feltham, Middlesex.

Absolutely WITHOUT RESERVE.

A PORTION of the exceptionally well-grown NURSERY STOCK, by order of Messrs. C. Lee & Son, the ground being required for other purposes. The Stock is in magnificent condition for removal, having been recently transplanted with great care.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Lee's Nurseries, Feltham, Middlesex, on THURSDAY and FRIDAY, December 10 and 11, at 12 o'clock each day, without reserve, thousands of exceptionally well-grown Specimen CONIFERS, the whole of which have been transplanted with great care, and will remove with safety. Specimen Conifers are a special feature at this Nursery, and the Auctioneers desire to call particular attention of Gentlemen and others to this important item in the Sale. The Catalogue will also include a grand lot of Specimen GOLDEN YEWs, 1500 CUPRESSUS ERECTA VIRIDIS, 2000 ENGLISH YEWs, 2 to 4 feet; 1000 HOLLIES, 1½ to 4 feet; 1000 named and HYBRID RHODODENDRONS, 1½ to 3 feet; and other Stock.

May be viewed any day prior to the Sale. Catalogues can be obtained on the Premises, at the Royal Vineyard Nursery, 2, Hammersmith Road, W.; and of the Auctioneers 67 and 68, Cheapside, London, E.C.

N.B.—In the event of frosty weather setting in, arrangements can be made for allowing ample time for removing the lots.

Havant.

EXPIRATION OF LEASE. SECOND PORTION.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the Sea View Nurseries, Havant, on TUESDAY and WEDNESDAY, December 8 and 9, at 12 o'clock each day, the SECOND PORTION of the particularly well-grown and healthy NURSERY STOCK, which is in exceptionally fine condition for removing, comprising about 8000 Ornamental Trees, 5000 Flowering and Ornamental Flowering Shrubs, 5000 beautifully grown Conifers and Evergreens; 3000 Fruit Trees, several thousands of Roses, for the growing of which, these Nurseries have a wide spread reputation, and a large stock of smaller Evergreens and Conifers suitable for the Trade for growing on.

May be viewed. Catalogues on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Sale next Monday. By Order of Mr. A. A. James.

THE TIVOLI NURSERY, Chapel Road, West Norwood. MR. W. N. WILLOUGHBY will SELL by AUCTION, on the above Premises, NEXT MONDAY, November 30, 1891, at 12 o'clock precisely, a choice collection of SURPLUS NURSERY STOCK, including 6000 Irish Ivies (part in pots), 3 to 6 feet high; choice Standard and Pyramid Apple, Pear, Plum, and other Fruit Trees, in full bearing; well-grown Evergreen and Border Shrubs, comprising 500 Aucubas, Eubonymus, Weigelia rosea, Guelder Roses, Irish and English Yews, Privet ovalifolium, Rhododendrons, Retinosporas, Golden and Green Hollies, Thujoopsis borealis, Cupressus Lawsoniana, and other deciduous shrubs; Sycamores, Planes, Mountain Ash, Copper Beech Trees, &c.

May be viewed this day, Saturday. Catalogues can be obtained on the Premises, and at the Auctioneers' Offices, 399, Norwood Road, and opposite the Railway Station, West Norwood.

On Wednesday Next.

TO GENTLEMEN PLANTING, GARDENERS, and OTHERS. Near the Horn Castle Inn, Bath Road, Reading. About 2½ miles from the Railway Stations, and opposite the Kennels of the South Berks Hunt.

MR. J. J. COOPER (of the firm of J. Omer Cooper & Son) will SELL by AUCTION, on the Premises, as above, on WEDNESDAY NEXT, December 2, 1891, at 12 o'clock precisely, a large quantity of FRUIT TREES.

The Sale will include a large selection of choice FRUIT TREES, CURRANTS and GOOSEBERRIES, ROSE TREES, COB, FILBERTS, and WALNUT TREES, LILACS, and SHRUBS.

On view day prior to and on morning of Sale. Catalogues may be had on the Premises; or of the Auctioneer, Blagrove Street, Reading.

SATURDAY, NOVEMBER 28, 1891.

CLASSIFICATION OF ROSE
GROWERS AND OTHER EXHIBITORS.

LIKE "Wild Rose," I have rejoiced and been exceeding glad in the peace and harmony, as well as the prosperity, that have so long distinguished the National Rose Society, though, like other judges and rosarians, I have frequently found the beauty and sweetness of Roses somewhat marred through the murmurings and thunderings of the smaller growers against the larger for invading their prize runs, as the smaller classes have been called. Now, so long as quality reigns supreme through all the classes, the best Roses only can win first honours, and no exhibitor is allowed to compete in the small as well as the large classes, and thus sweep off all or the lion's share of the prizes, exhibitors have little to complain of, and societies must endure the grumbings which are the safety-valves of some exhibitors after being beaten. Even some rosarians seem to need a long life-time to learn to take that useful discipline with becoming dignity, and such seek and find a sort of consolation, by attempting to drag the element of unfairness into their loss of money and credit. Anyhow, such grumbings seem inevitable, and are probably as old as the art of stimulating superior culture through the awarding of valuable prizes for the best products at public exhibitions.

Nothing is easier on paper than to lay down such abstract propositions as that exhibitors should only compete with their peers, that is, those having an equality of power and privilege granted. But who are our peers in such matters, and how is the equality of advantages to be determined, and where is the sense of squabbling over mere area and quality of labour, when such potent factors to successful showing as the skill of the exhibitor, the quality of his soil, the facilities of his position, the character of his stock, the potency of his stimulants, &c., are necessarily left out of the reckoning? I agree with "Wild Rose" on both of these points. The best skilled labour of professional gardeners will win few or no first prizes at the National or other Rose shows, unless the blooms are wisely set in the eyes of the judges on the show tables. Humiliating as it may seem, it is nevertheless true, that as many or more prizes are won through the final placing and arrangement of the blooms as through the growing. Yes, it is the final touches that win, and unfortunately many skilful cultivators seem incapable of giving these finishing touches, or capitating arrangements, to prize boxes. And then from what source has area or size been accepted as a measure of quality? or in what other department of art or science, excepting in Rose growing, is the mere counting of heads accepted as a safe or sound basis for

any useful classification of quality? And how many small growers would admit that they do, or can only grow inferior Roses to the larger growers? On the contrary, how often in practice is the shoe found on the other foot, and the small grower is found among the leading prizetakers? And how are we to determine between large or small? Is 500 or a 1000 to be the limit? and are all sorts and conditions of Roses in the garden to count? and who is to count them?

The plan is impracticable, and therefore cannot be adopted. Neither is there any necessity for it. The grower with 500 Roses can grow them as well or better than his neighbour with 500,000. True, he cannot fill so many large classes, nor is he required to do so. Smaller ones are arranged on purpose to suit his means and his capacities. But then he complains that the larger grower shows in these and robs him of his just and fair chances. But so long as these large growers do not also show in their own larger classes, where does the injustice to the small grower come in? On the contrary, the larger grower who thus stoops to conquer money prize in the smaller classes suffers a grievous loss of credit, and should he suffer defeat by the smaller grower—a thing not unknown in the annals of Rose showing—his humiliation is complete and the pride and glory of the smaller grower is beyond description.

So long as the entries are made some time before the show, and no shifting and chopping about of classes are allowed at the last moment, with a view of prize-grabbing, and all classes and sizes of exhibitors are treated alike, there is little reason to complain.

There is, however, one great grievance all too common at Rose shows, though probably quite unknown at the National Rose Society, which ought to be abolished at once, and that is, the secretary and other officials appearing as exhibitors also. The evils and abuses of allowing this are so obvious, that all such dual functions should be at once abolished. Secretaries, with their official knowledge of the numbers of entries in each class, can so place their own exhibits as to be sure of winning, to the serious injury of other exhibitors, and such pot-hunting, which the writer has seen again and again, is as fatal to the permanent prosperity of societies, as it is discreditable to rosarians. The latter should be above suspicion, and to make and keep them so, it is hoped that during the forced repose of the coming winter, every secretary will resolve to show no more Roses at his own society's show. Beyond this common-sense reform, it may neither be possible nor desirable to proceed much further by way of classification or restriction. Who shall say how many societies have been rent into fragments in the vain attempt to classify exhibitors under the threefold divisions of growers for sale, gentlemen's gardeners, and amateurs. And every year these classes get more mixed, and the number of gentlemen's gardeners and amateurs who never sell fruit, plants, or flowers, to say nothing of vegetables, become fewer and less. And hence largely the hopelessness of establishing any other classification or standard of merit than that of the highest excellence. Let the best Roses win, though the heavens fall, and all but the best blooms return home prizeless—an almost equally appalling catastrophe to mere prize-hunting exhibitors. If merit cannot always meet with its due reward on our present lines, then I should try levelling down to equality by reducing the larger exhibits, and throwing all classes open. Under present modes of showing, one is startled at times, with

the low quality of the 1st prize blooms in some classes. On inquiry it will be found that these are badly filled, and that the Roses have had first prizes awarded because they are the best, jurors disliking to disqualify a stand. It is high time that all awards, unless for the best Roses, should cease to be made at the National and all other Rose shows. *Rosa*.

NEW OR NOTEWORTHY PLANT.

DENDROBIUM LEEANUM, *n. sp.* (fig. 88).

THIS is a handsome new species imported with *D. Phalaenopsis* var. *Schroderianum* by Messrs. F. Sander & Co., of St. Albans. The plant has pseudobulbs, about 3 feet in height, stout, and slightly compressed, and somewhat resembling those of *D. taurinum*. The upper portion of the pseudobulb bears stout sprays of handsome flowers, arranged after the manner of those of the *D. superbiens*, well illustrated in the *Gardeners' Chronicle*, January 12, 1878, p. 49. The habit of the present species, however, is different from that of *D. superbiens*, and the flowers are distinct in all points, and more especially in the open form of the labellum, the side lobes of which are not folded over the column as in *D. superbiens*, and in the petals being narrower than the sepals. The sepals are formed like those of *D. Phalaenopsis*, white at the base, and tinged and freckled with pink on the outer halves. The petals, which are slightly twisted, are of a bright rosy-crimson. The labellum is green at the base, with radiating reddish lines, and the front lobe and the margins of the side lobes are of a rich rosy-crimson. From the base of the lip run three ridges, which extend to the upper part of the front lobe, where they become wavy, and display a tendency to develop some additional slightly-raised ridges. It is a very showy species, and it is to be hoped that other examples of it will appear. It is named in honour of W. R. Lee, Esq., of Manchester, a keen collector of rare Orchids. *J. O'B.*

THE ROSERY.

ROSES IN POTS.

THIS may be said to be the very dullest season of the year for our choice plants in pots, of which the Tea-scented varieties may well hold the first place, and hybrid perpetuals the second. That is the position most tasteful persons would place them in; and for flowering in the autumn as well as in the spring and summer, the Tea-scented varieties are the most truly perpetual. They are supposed to be more tender than the hybrid perpetuals, and some of the Tea-scented varieties are certainly of weak constitution. Such, however, ought not to be grown, as there are so many varieties now in cultivation vigorous enough for anything, and of the highest quality as regards the form, colour, and substance of the flowers.

All the plants should be now under cover. A glass house is best for them, and they must be kept dry at the roots. As soon as they are well on the dry side they should be pruned. The cut portions will not bleed if the soil be sufficiently dry; and if no water applied for a week or ten days after, the wounds heal, and water may then be safely given to the plants. Some persons apply styptic to the cut portions to prevent bleeding; this can do no harm, but I find that it is not really needed. If the plants are kept merely in a greenhouse temperature, the buds will soon swell up and show signs of growth, and if forcing is begun about the end of the present month (November) or early in December, it is better that the temperature of the forcing-pit should not be higher than that of a warm greenhouse at first; place the plants near the roof, and give rather free ventilation. As growth progresses, 55° at night may be kept up, with a little increase by day. The plants will not start very freely, nor will the growth be very strong, unless

the Roses are well established. I recommend repotting them in August, or not later than the middle of September.

Cuttings that were put in under glasses in July form nice plants by the end of the season, and may be planted singly in 4 or 5-inch pots; or they may be planted in a favourable position out-of-doors, and with a slight protection of dried fronds of bracken they will not suffer injury from frosts. *J. Douglas*.

THE WINTER PROTECTION OF ROSES.

THIS is a very important item in the cultivation of Roses, for if the plants are over-protected, the results are often quite as disastrous as when they have received no assistance in withstanding the rigours of winter. Generally speaking, Roses are either over-protected, or else they are left to take their chance. This first is more particularly the case among small amateurs, who are unduly careful over their favourites. The majority of large growers give very little protection, experience having shown them that plants that have been sheltered from almost all hard weather are apt to break into growth prematurely. If these extra early growths escape actual frost, they are seldom able to carry good flowers, because the cold, unfavourable nights cause the buds to bind, and when the bloom does eventually open, there are green and hard cores in the centre of the flowers.

Dwarf Roses, of whatever class, are far best protected by a fair mulching of light stable manure and by having the soil drawn up around the base of the plants, thus earthing them up some 6 to 9 inches. This plan is all that they require, unless we get very piercing cold winds with frost, when it is advisable to stick a few pieces of Gorse, Birch twigs, or any similarly light material among their tops. The two things I have named give a great deal of protection, are very easily stuck into the soil, and best of all are so readily removed in a few minutes without leaving any unsightly litter. They also have the great advantage of not accumulating any moisture, and in this respect are far beyond hay, straw, or even the Bracken Fern.

Anything that retains moisture is unsuitable for protecting Roses, as the frost has far more effect when the material around the plants is wet.

Standard Roses can be protected by tying a little Bracken Fern around the stems loosely; and by a few Birch or Gorse twigs being set in among the tops of the plants, and then fastened securely to the stem of the Rose. One of the chief things in protecting standard Roses is to take the precaution of keeping very severe frost away from the Briar stems. More mischief is in reality done to this form of Rose from their stems being crippled by frost than any other thing. My Roses are nicely ripened, and I do not anticipate any harm from frost during the coming winter, unless, as was the case last year, we have an extra severe time for them to pass through. Unless Roses are well ripened, their wood can stand but very little frost. I am certain that most of my plants will stand 10° to 12° before being injured in any way; and beyond the fact of earthing up a few of the choicest, I shall not afford any protection until we get more severe weather. When Roses, or any plants, are quite dormant, they can withstand a far greater amount of frost than if they were only half-matured or ripened. The hardest of trees and plants are injured by both early and late frosts if they are not at rest. I would warn my readers against neglecting to protect their Roses against very cold and piercing winds. Any keen wind with a few degrees of frost in it will be much more injurious than 15° with a comparatively still or quiet atmosphere. *A. P.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT WILLESDEN.

THE excellent group of Brazilian *Oncidium* in flower, for which Messrs. Collins and Collins, of the Cumberland Park Nursery, Willesden Junction, were awarded a silver Medal at the last October meeting of the Royal Horticultural Society, was but a fair sample of the high state of culture to which the two young Brothers Collins bring most of the Orchids taken in hand by them. In the large span-roof

show-house at the present time the roof is laden with profusely-flowered specimens of *Oncidium varicosum* in many varieties; *O. pratextum*, in all shades, from light brown to chestnut-red; *O. tigrinum*, *O. Forbesii*, and others of that class, all richly laden with bloom, the quality of which may be imagined when it is said that one spike of a fine form of *O. varicosum* had 144 flowers, and another specimen has two spikes of 130 blooms. Many growers say these plants flower once, and then die, but grown cool and airy as they are here grown, the plants get stronger, and flower better every year; and yet one would suppose there are many better places in which to grow Orchids, for the houses are close to the great Junction, and not many yards from the railway itself. The fact is, that good culture meets with success even in unfavourable situations, while bad management cannot get good results in Orchid culture under the most favourable conditions.

At the Cumberland Park Nursery, suspending Orchids in baskets or hanging pans is much resorted to, and marvellously do the plants thrive in them. The numerous specimens of *Odontoglossum citrosimum*, *Oncidium tigrinum*, *Odontoglossum grande*, *Laelia anceps*, &c., suspended in a long

placed in several of the other houses, in order to test in which they will thrive the best.

Orchids are to be found suspended in most of the other houses, which are devoted to the culture of market Ferns, *Azalea indica alba* for cutting, and other plants useful for market work; but a neat block of four long span-roof houses contains the chief of the stock, and their occupants are in admirable condition. The first house of the block has *Cattleyas*, *Lælias*, *Vandas*, &c., together with other showy species, *Cattleya aurea* and some others being in bloom. The second house has one side occupied by fine plants of *Cypripedium insigne*, with broad stout leaves, and each well furnished with bloom. This plant is marvellously well grown here, and amongst the stock are some extra fine varieties. Much of their satisfactory condition is attributed to their being made to pass the summer in cold frames, and doubtless many other species would be benefited by similar treatment. Suspended in this house were many fine pans of the showy *Sophranitis grandiflora*, also quantities of large masses of *Cattleya Percivaliana*, and a few dozens of the beautiful *C. chrysozona*, an introduction which has already produced some very handsome things, and some of which are like *C. aurea*, but

get enthusiastic, and himself indulge in the very figures of speech which previously he had made up his mind to consider as auctioneer's rhetoric!

The plant is stated to come from North-East New Guinea, but is clearly very closely allied to the North Australian *D. phalenopsis*, of which indeed it is recognised as a variety. The general habit of growth is shown in the sketch on p. 642 (fig. 89). The racemes, which frequently branch into panicles, have slender wiry stems straight below, but bent zig-zag fashion near the top, the pedicels springing from the axil of a minute bract. Of these flower-bearing pedicels we counted in one case fifteen on one panicle, but the dried specimens show as many as twenty-six flowers. The flowers themselves (figs. 90, 91) are cup-shaped, pentagonal in general outline, and varying greatly in size and colour. A medium-size flower on our table measures 60 mill. (say, 2½ inches) across, and 45 mill. (1½ inches) from the apex of the upper sepal to the tip of the lip. In colour the range is from almost pure white to deep violet-purple. In some flowers the outer segments are of the same tint, or nearly so, as the inner, whilst in others the lighter hue of the sepals contrasts beautifully with the richer colours of the petals and of the lip.

The outer segments are lanceolate, with a fine point at the tip, and traversed by about twelve closely-arranged veins. The lateral petals, spread out flat on either side, are broadly wedge-shaped at the base, dilating upwards into an obovate rhomboid limb more than twice the width of the sepals, and with about sixteen divergent veins. The lip, as a whole, forms a broad tube, projecting forward, enclosing the column, and prolonged at one end into a trumpet-like spur; at the other, into a tongue-like fore-lobe directed downwards. The basal part of the lip forms a compressed, funnel-shaped, blunt spur, about 15 mill. long, and the front portion of which is jointed to the narrow base of the disc of the lip. This disc is three-lobed, the side-lobes rounded, erect, curved over at the top to form the throat, the centre traversed by three or four slightly prominent ridges of a darker purple than the remainder of the lip; fore-lobe oblong, rounded, apiculate, bent downwards. The column is short, high-shouldered, striped with purple, with a small white anther at the top of a transverse bar-like "rostellum," which forms the upper boundary of the wide stigmatic cavity.

The mechanism of the flower is easy to understand. The insect slights on the flat fore-lobe of the lip, which is displayed to attract his attention. It traverses the tube or throat of the lip, the joint or hinge of which acts as a spring to keep him in the way he should go to secure the honey in the spur, a process still further facilitated by the ridges on the lip. Thus coaxed and forced to take the right course, he must needs knock off the anther cap, liberate the pollen masses, and transfer them to the next flower he visits.

Among the flowers kindly placed at our disposal was one shown in fig. 92, wherein the lip had retained the form ordinarily reserved for the side petals only; that is to say, the lip had not run away as it generally does, from its more symmetrically-formed brothers. In connection with this, the spur was much shorter than usual, and the column had two perfect anthers instead of one. Such a flower would afford a gleam of joy to the florist enamoured of circles, and who squeezes all the history and interest out of a bloom in order to make it conform to his notion what a flower should be like! Such a flower affords a more legitimate delight to the botanist, for it tells a tale, showing him how the Orchid flower was made, how modified, and why, what its ancestors were like, and what are the relatives of existing Orchids. This particular flower, moreover, is interesting, as showing that these peloriate flowers are not always terminal, for this one was lateral and at the base of the spike, a fact that recalls a correspondence on this very subject with the late Charles Darwin, who considered such flowers to be more exclusively terminal in their position than the present writer could or can admit.

FIG. 88.—DENDROBIUM LEEANUM. (SEE P. 640)

house which had formerly been used for Ferns, and most of which were in bad condition when purchased, one and all exhibit in the annual increase of the size and vigour of their bulbs, their appreciation of the treatment given them; indeed, it seems difficult to imagine further improvement in many of them, while the same floriferous character extends to all the stock in this rising establishment. In the beds in this long house are large batches of *Cypripediums*, *Cymbidium Lowianum*, freely sending out flower-spikes; *Celogyne cristata* in all its forms, &c. It should be noted that in all the houses large soft-water tanks are built beneath the centre walks, and are left partially open for the purpose of dipping water. The plan may not be altogether convenient, but it is certainly beneficial to the plants.

In another long house were some scores of pans of *Cypripedium bellatulum*, which formerly gave some trouble by damping off in winter. This difficulty has been got over by Messrs. Collins by potting the plants in lumps of chalk, and sphagnum moss, and suspending them in this rather moist intermediate-house, water being now very sparingly given, and will be discontinued when dull weather and the winter set in. So far the plants like the treatment well, and it is anticipated that by being kept short of water until they begin to root actively, the root-action will be more complete and effectual than it would if the plants had been kept wet previously. Experimental batches, too, of this *Cypripedium*, arranged after the manner above described, are

with white sepals and petals. The third house has *Zygopetalums*, *Dendrobiums*, and other good species, with the beautiful yellow *Oncidium varicosum*, which is found in most of the houses, suspended overhead, and the fourth house is filled with sturdy, well-grown *Odontoglossum crispum*, *O. Pescatorei*, and other *Odontoglossums* and cool-house *Oncidiums*, among which some of the *O. macranthum* have very large and stout bulbs.

Reasonably cool treatment for all classes of Orchids, and the free admission of pure air, are the main points observed in bringing about the pleasant state of things to be found in the Cumberland Park Nurseries, and Messrs. Collins & Collins are to be congratulated on their success in growing the showy species they have hitherto attempted.

DENDROBIUM PHALENOPSIS VAR. SCHRODERIANUM.

The visitor to Messrs. Sanders' richly-stocked establishment at St. Albans may enjoy at the present time a sight of no common interest and beauty in the inspection of what has been called the Elephant Moth Dendrobe. A good many superlatives have been made use of in alluding to this plant. Those who will go and see for themselves will come to the conclusion that the plant is none the better for these high-flown epithets, which lead rather to distrust than to confidence. But in presence of the flowers themselves the visitor is apt to

But the ordinary Orchidist cares little for such details as these, and the general reader still less. To conciliate and attract the latter, we must unfold a tale of horror in several chapters, and in Mr. Sander's own words:—

"About eighteen months ago our collector, to whose indefatigable zeal and perseverance we are indebted for the importation, arrived with nearly 400 plants at a small port in New Guinea; the ship caught fire, and every soul on board had to take to the boats. All lives were saved, but everything else lost. We received a cablegram with the words, 'Ship burned, everything lost, what do?' This telegram was confirmed by the news in the morning papers. After wiring back, 'Return, try again,' we got the reply, 'Rainsy season on,' and wired once again, 'Return, collect more.' The intrepid collector obeyed our orders. . . ."

Quite a sensational story might be written about the discovery of this wonderful Orchid. We give the letter from the collector. He says:—

"With great pleasure I announce to you the fact that I arrived here yesterday with my plants in the finest order, and you will get striking novelties at last from this terrible country, and you will have every reason to be satisfied. It was the best time to collect the Dendrobe; they had just finished growing, and some were in full bloom, and oh, what a glorious thing it is! I forgot all my troubles when I saw the first on some rocks near the huts where I was staying, where they grew on the bare limestone between a great number of human skulls and bones. The natives do not bury their dead, but put them in a kind of coffin, and then place them on these solitary rocks, which stand scattered about the shore or beach, and which can be reached only at ebb tide. Here in these rocks the plants grew most luxuriantly, exposed to the full sun, and when the weather is rough, they often get the spray of the sea water. At first the natives did not like the idea of collecting the plants off those rocks; they were afraid the souls of the departed whose bones were laying there bleaching in the sun would resent it; but when they saw the gorgeous handkerchiefs, beads, looking-glasses, and my brass wire, I offered them for the plants, they did not trouble themselves any more about the souls of their ancestors, but boldly went and rooted out every plant to be found. . . . The majority of the plants, however, come from places where no bones were found. The plants grew chiefly on these solitary, much-honeycombed, limestone rocks, always exposed to the sun, or getting only very little shade during a part of the day. It also grows on trees in the Ficus groves more inland, although very sparingly. I found the big specimens on the highest trees in the dense jungle, where it is very rare, and I only saw a few on the very highest trees. I should think in cultivation it will require plenty of moisture while growing, and a culture like that suitable for *D. nobile*.

"In size and colouring it varies as much from the ordinary *D. Phalenopsis* as *Dendrobium Wardianum* from *D. crassinode*; the largest flowers measured $4\frac{1}{2}$ inches across, none measuring less than $2\frac{1}{2}$ inches. I saw a few plants with branched spikes, but this seems only excess of strength; the spikes are generally from 20 to 35 inches long, on some I counted up to twenty-five flowers. The colour is very variable, varying from pure white to dark purple red, and some are differently coloured and variegated, but bright and clear; the flowers last a long time, individually eight weeks, and during my stay of three months I saw many plants flower in April, May, and June. I only hope and wish I may get safely back again, and that the plants will arrive in good condition. . . ."

"Going by myself there would mean endangering my health very much, so I think it is better to wait till next year, when I can go with a trading expedition. On my arrival here, I had to pay 200 dollars as a shipwrecked man for my passage, for which I told you they at first demanded 280; now, on my telling them it was very mean to demand anything of a shipwrecked man, they gave me 30 per cent. deduction. Well, there is no doubt these people (the European traders) are the meanest people on earth, and I do not like them, and shall be glad when I can travel somewhere else. The natives are not bad, only somewhat troublesome; they think no more of killing anybody than your cook does killing a fowl, but they would not easily attack a Dutch trading party, knowing how well armed they are, especially when one takes a little care not to quarrel with them. They go almost entirely naked, and are the finest race of savages I have seen up to now.

"One of their idols, the god with golden eyes, I had to place in a case to accompany the plants, and take care of them on the journey; the savages wanted this, and I did it to satisfy their superstition. They always carry these gods in their battles. I put all the plants in baskets I had made by the natives here, and when all were packed, they gave a war-dance in front of them."

For sentimental reasons, we regret to say that the golden-eyed idol above referred to was the very first article sold by the sacrilegious auctioneers!

Can anyone fancy more violent contrasts, the lovely Orchids, the naked cannibals dancing amid the bones of their ancestors, the enterprising collector not oversure that he would not himself form part of

their next meal, and that his bones might not be added to the pile, the religious sentiment which prompted the despatch of the idol with the Orchids, its sale in a London auction room amid the laughter and jeers of a concourse of unsympathetic Orchidists? Surely here are the materials for a thrilling romance indeed!

FORESTRY.

FORESTRY FOR NOVEMBER.

Now that the young growths of forest and ornamental trees have matured their growth, and the wood become ripened and firm, no time should be lost in commencing planting operations when the weather is favourable. Leather ground in the deer forest and elsewhere at high elevations, where the ground is dry and hilly, should have particular attention, in order to push forward the planting as fast as is con-

up and pulverised with a pick previous to inserting the plants, and I am glad to say that the work proved a complete success. When viewing these plantations some few years ago, the *P. s. pumilio* had formed fine, healthy, spreading bushes, which showed the utility of planting it for covert in such situations. Of course it must be understood that this Pine never attains to the size of a timber tree; but for planting on damp boggy ground, and high exposed situations for covert, it has no equal among the Pine tribe. Stiff adhesive clay soils, and cold peat bog that retains excess of moisture, however, should not be planted at this season, as the roots of the plants are apt to suffer damage while lying in a dormant state in the cold soil during winter. In planting this class of ground, I have found the best results by using stout plants, and by inserting them in pits.

The pits may be opened now, or any time when convenient during frosty weather in winter, and the stuff excavated left in a rough state on the edge of

FIG. 89.—*DENDROBIUM PHALENOPSIS* VAR. *SCHODERIANUM*: SHOWING HABIT.

sistent with the proper execution of the work before the short days of midwinter. This is a most important point in connection with good forestry, as the work can be done at a cheaper rate in autumn than in winter; besides if the plants are inserted with care, very few of them perish or suffer damage, as compared with winter planting. Leather ground can be planted in a very efficient manner by the notch system of planting. Scotch Fir and Larch, two-year seedlings, one-year transplanted, are the best size of plants to use, as they have generally better roots than seedlings; and, besides, the wood of the stem is of a firmer texture than seedlings, and is therefore not so apt to get shrivelled up by frost during winter on exposed elevations.

Many years ago, when planting the deer forests for H.R.H. the late Prince Consort on the Balmoral estate, I used a number of *Pinus sylvestris pumilio* on hard heath ground, resting upon an impervious pan or till, where even the hardy Birch never attained to a useful size. In this case, I had the hard soil broken

the pit, exposed to the influence of the weather till spring, by which means it will become pulverised and converted into an active and fertile condition as food for the roots. On the other hand, hard hilly ground that can be planted on the notch system had better be broken up with a tramp-pick at the spots where the plants are to be inserted, by which means the plants will get a good start, and when once they become established they will break up the ground for themselves.

In the formation of ornamental plantations for immediate effect, the better plan is to trench the ground at once, as by so doing plants of larger size can be used, and the ground will present a furnished appearance at once. This, of course, entails extra expense at the outset, but in many cases under such circumstances this is but a matter of secondary importance. In all cases where the ground is of a damp or wet nature, let me impress upon the mind of the planter the utility of draining, as in all cases where it is necessary it should take precedence of all

other operations, and for want of this precaution, many plantations have exhibited a stunted appearance from the commencement.

In frosty weather, when planting is at a standstill, the felling and removal of heavy timber, as well as the thinning of young plantations, should be proceeded with, when hands can be spared from other work. Drains are now being choked up with tree

the year round; *Acrostichum decoratum*, which is very rare, the petioles covered with golden streaks, and the foliage bordered with similar blotches; *Panax excelsa*, a plant with ornamental foliage, which is almost evergreen, and flowers which resemble small coral berries; *Blaberopus venenatus*, D.C.; *Apocynum*, from Bengal, with beautiful clusters of pure white flowers, in shape like those of Peri-

These grow well in the pebbles and rubble, and the plants could not be more vigorous and sturdy if they were growing in the usual way. *Ch. de Bosschère.*

CHRYSANTHEMUM CULTURE.

I have visited the establishment of M. J. Ph. Dewolis, at Boitsfort-lez-Bruxelles. The reputation attained by this grower for the culture of these

FIG. 90.—A FORM OF FLOWER OF DENDROBIUM PHALENOPSIS. (SEE P. 641.)

FIG. 91.—A FORM OF FLOWER OF DENDROBIUM PHALENOPSIS. (SEE P. 641.)

leaves and rubbish, all of which should be removed, as they are apt to impede the discharge of water, which, if allowed to lie in a stagnant state, will damage the roots of the tree, and lay the foundation for disease. These leaves should be collected into depôts here and there, and allowed to rot, when they will prove very valuable for manure. Make up gaps in old dilapidated hedges, and in cases where the soil has become exhausted, a little fresh soil and manure added will prove beneficial. Plant new hedges of Whitethorn, Beech, &c.; the Beech answers best for warm calcareous soils, and the Whitethorn for any ordinary texture of soil, providing it has been well prepared by trenching before inserting the plants. The seeds of forest and ornamental trees should be looked after at this season, and gathered as they become ripe, choosing a fine dry day for the purpose. When collecting the seeds of the Oak, the largest sizes should be preferred of *Quercus Robur pedunculata*. In the nursery department, vacant ground should be trenched or deeply dug, and left in a rough, open state, so as to admit frost during winter, and poor soil that has become exhausted, should receive a good dressing of thoroughly-decomposed manure to renew and increase its vitality. *J. B. Webster.*

winkle—the plant is very free-flowering; *Sterophoma unrantiaea*, with remarkable and unusual blooms, whose stamens project a considerable distance, giving flowers a very light appearance—the calyx is orange-coloured, the corolla golden-yellow.

flowers of autumn, and his successes at all the great exhibitions, have attracted considerable attention in the horticultural world. Five immense houses were literally filled with thousands of specimens, covered with large and beautiful heads of flowers, all grown on a single stem not more than 3 feet high. On a specimen of *Etoile de Lyon*, I counted twelve flowers each measuring over 12 inches across. Among the best varieties, those which in beauty and perfection of flower, and as plants are most suitable for cultivation, I should mention *Etoile de Lyon*, of a beautiful rosy-pink colour; *Madame Louis Leroy*, beautiful and white; *Wastoff*, pure white; *H. Lincoln*, a rather deep yellow; *Phitzer*, with many blooms, &c. We admired the fine blooms of the famous *Mrs. Alpheus Hardy*, but the plant leaves something to be desired. *Ch. de Bosschère.*

FIG. 92.—A PELIOSTRATE BLOOM OF DENDROBIUM PHALENOPSIS. (SEE P. 641.)

TOADS AND SLUGS.

It may interest you to know that my experience as an amateur horticulturist in this distant island exactly corresponds with that of French gardeners, as mentioned on p. 371 of the *Gardeners' Chronicle* for September 26, 1891. Since I bought my place, thirteen years ago, I have done all I could to preserve the toads on it, and in consequence I have never suffered severely from slugs, while other persons have had their gardens all but destroyed by them. In some gardens toads will not remain, even if introduced; these gardens suffer most from slugs. I may add that our slugs are especially fond of all the Orange tribe, and will ascend good-sized Orange trees to feed upon their leaves. *J. J. Bowrey, Kingston, Jamaica, W.I.*

JUBEA SPECTABILIS.

Someone has written to you in praise of the hardness of this Palm. Let me caution your readers on the point of its slow growth, and the want of beauty at certain ages. I planted several *Jubeas* thirteen years ago in a patch of *Phoenix canariensis*, of *P. dactylifera*, of *Pritchardia filamentosa* (which our gardeners here now begin to call "Washingtonias"), *Acacia dealbata*, Tangerine Oranges, and *Cocos australica*. My soil is good, and climate

FOREIGN CORRESPONDENCE.

BRUSSELS.

On the occasion of a visit made to the houses of the Botanic Garden at Brussels on the 10th of November, a white variety of *Meyenia erecta* was remarked, which was of very graceful habit; *Oncidium varicosum Rogersi*, with large blooms, the lip much developed and deep, bright yellow; an uncommon variety of *Cattleya pumila*, remarkable for the size and regularity of the flower—the lip very deep purple, and parted in the centre by a broad band of pale pink; *Clerodendron squamosum Kämpferi*, a very old plant, which blooms nearly all

In the Orchid-house were noticed a very great improvement. Except during the flowering-season, Orchids are not very beautiful. *M. Lubbera* grows *Vandas* and *Sonerilaa* in sphagnum moss, where they do perfectly, and were in full bloom when I saw them. The effect is charming. Who knows whether it would not be possible by this means to grow in hot-houses, in sphagnum moss, those gems which are known as *Bertolonias*. On the stage in the Orchid houses, *Begonias*, *Ferns*, *Marantas*, and other plants with ornamental foliage, are used for borderings.

magnificent; and the Canary Palms, Date Palms, Pritchardias, and Acacias, are now great trees, and the Tangerines fine bushes, laden with fruit, but the *Cocos australica* and the *Jubæas* remain small, though the latter are extremely healthy, and still pretty on the ground. My friend, M. Emile Ollivier, has some *Jubæas* of sixteen years' growth, of which most have remained small and pretty. One has shot up, and is certainly no longer "spectabilis," but a fright, though it is healthy. I shall not plant another.

While I am writing, may I add that the gardeners at the Jardin d'Acclimatation at Hyères are now selling a *Cocos robusta* which is more hardy than the other *Cocos*, and which is the plant sold at other florists on the coast as *Cocos australica*. It is not the *Cocos australica* which we used to buy on this coast up to ten years ago, and is glaucous, not green. *D., Toulon.*

HIGHBURY, BIRMINGHAM.

In looking through the gardens attached to the residence of the Right Hon. Joseph Chamberlain, M.P., I saw in bloom a very old but seldom-seen plant, *Amasonia punicea*, described in Loudon's *Hortus Britannicus* as of the order *Verbenaceæ*, a native of Trinidad, introduced in 1825, and shown by Messrs. J. Veitch & Sons, Royal Horticultural Society, Sept. 9, 1884, when it was certificated. It has long pendent spikes of rich crimson bracts, from which hang tube-shaped flowers, white, tipped with green. Mr. Cooper has some good specimens of *Pteris serrulata Smithiana* in the fernery, and there can be no doubt as to this variety being a decided acquisition. In the long corridor connecting the numerous Orchid and other houses with the rock-fernery and the conservatory, a seldom-seen greenhouse shrub is now in flower, *Ardisia Oliveri*, with corymbs of rosy-lilac flowers; and in one of the stoves the noble *Anthurium leodiense* is in bloom.

In the conservatory are two fine specimens, in full bloom, of the superb *Lilium Wallichianum superbum*, referred to in the *Gardeners' Chronicle* of Oct. 24 by Mr. J. G. Baker, and to which I must refer your readers for the full information he gives regarding it, with its pale primrose flowers with rich cream throat. It is easily propagated from the numerous bulbils at the axils of the leaves, and it is very free flowering. In the conservatory also are several specimens of *Lilium tigrinum splendens*, rich in their scarlet colour, and with from fourteen to sixteen blooms on a stem. These, with a lot of lancetium varieties, help materially at this time of the year in giving variety, and adding beauty to the autumn indoor flowers. Winter-blooming *Begonias* are also cultivated here, and amongst them, varieties such as *Valleriana*, a lovely and free-blooming, deep rosy-scarlet flower of compact habit; *Moonlight*, a small-flowered very free-blooming white, of close habit; *semperflorens rosea*, a tall-growing kind, with shaded rosy-pink flowers; and *Arthur Mallet*, and *B. incarnata var. papillosa*—the two latter with rich dark foliage and pink flowers. These are all easily cultivated, and most acceptable winter-blooming plants. *H. D.*

SHELTER AND SEA BREEZES.

In a garden by the sea at Douglas, Isle of Man, I had an opportunity early last autumn of comparing the hardiness of various plants and flowers, and their power of enduring sea breezes. A sea-captain, fond of flowers, has made his house under the cliff in a particularly snug spot, well sheltered, except on the south side, where the sea-wall is about 40 yards distant, the sea itself, when rough in its humour, sometimes coming rather nearer. It was on Aug. 28 that the garden in front of the house, nicely fenced from the street, attracted my notice as the smartest garden in the neighbourhood, and the cause of this superiority was not far to seek, for the worthy captain was at work amongst the flowers—and flowers, we all know, prove exceedingly grateful for the personal care of those who love them. There had been a

storm, which had guillotined all the tender plants that happened to be looking over the wall at the time of its occurrence. The captain was mourning for several of his favourites, which is the way with human nature; but it was not, perhaps, quite reasonable, since he still retained twenty blessings for each one removed. Some plants can bear a blast from the sea far easier than others. The *Dahlia* can bear but little either of rough wind or frosts. Long as it may be since the *Dahlia* first appealed to my sense of beauty, it never delighted me more than this year. I had seen it in many noble gardens during the late summer, but a large bed in Dulwich Park pleased me more than any other last season. I shall not soon forget pausing long to look at this bed for the last time. It was the largest of several handsome beds on the lawn of one of the entrance lodges, and it was pleasing to think how many people can now enjoy good gardening in our public parks. The date was October 30, and the day was bright and sunny. There had been already some slight frosts, and a catastrophe was not far distant. In the night there came a sharper frost, and next day the beauty of the *Dahlias* was a dream of the past. The bed had been blackened and smitten with ruin.

In the captain's garden, the *Dahlias* above the wall, as well as the *Heliotropes*, *Tropæolums*, and *Calceolarias* were much cut, wholly destroyed in fact by the stormy blast that blew before August 28. *Sycamores*, in the full blast, were cut; but a very little shelter—a slight screen sufficient to strain the brine and break the force of the wind, had sufficed to preserve many of the flowers, as well as shrubs and trees. All the low specimens under the walls and hedges of the captain's garden, and those of his neighbours, were safe. The *Asters* and *Pelargoniums* and even such dainty flowers as the *Phlox Drummondii*, were still brilliant. A very little shelter had sufficed to keep in health and safety such plants as the *Roses*, *Virginia Creeper*, *Veronica*, *Convolvulus*, *Fuchsia*, *Delphinium*, and others, so that enough flowers remained to delight their owner's heart, and I hardly think he would grieve long for the lost specimens after their removal to the rubbish heap. The captain's garden behind the house is terraced, and absolutely sheltered from the north. He was kind enough to show me up the steep steps which lead to his kitchen garden, which is a limited space on a ledge above the level of his roof. Here *Jargonelle Pears* ripen on the wall, and one of the trees was loaded with ripe fruit, which the wasps seemed to appreciate. The following plants were growing luxuriantly on the face of the cliff wherever they found sufficient soil to root in, *Scotch Fir*, *Gorse*, *Tamarisk*, *Privet*, *Daphne Mezereum*, *Escallonia*, *Aucuba*, and *Ivy*. Among these the three first-named and the last are probably the most hardy, and the best adapted for the formation of screens to break the wind near the sea. Common *Ivies* are extremely hardy.

In the garden of an adjoining hotel, having a breastwork in front, concealing and sheltering it, the bedding plants had not suffered. An oblong bed of rose-coloured *Pentstemons*, edged with dark *Pansies*, was exceedingly handsome. The *Hex* trees and *Rhododendrons* in the same garden remained uncut by the storm. Above the captain's house, on the top of the cliff, is a commercial garden attached to the Industrial Home for Destitute Children, where the eldest boys among ninety children, mostly very young, with the help of one man, dig and cultivate 6 acres of ground. I shall not enlarge on the vegetables, the most profitable of which—early *Potatoes* and *Peas*—were over on August 28; nor do the *Strawberries* belong to my subject, but I may notice the flower garden in front of the house. A thick screen of several sorts of trees had served to protect this garden, which did not therefore offer much material for comparison; but it may be useful to mention that the hardiest *Pelargonium* on this exposed site is the tough old *Bijou*, green tipped with white, and known to the gardeners of a past generation. The fancy sorts of modern date are much less hardy. *H. E.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

SEA KALE.—All of the plants should be cleared of their leaves, the soil hoed and raked, and afterwards drawn up in the form of a ridge over the plants, as protection to the crowns from frost. Continue to place from time to time roots in heat, so that no break in the supply shall occur.

HORSERADISH.—If this crop has been grown as recommended by me in the spring of this year, the roots may now be lifted. To do this expeditiously and well, dig out a trench at one end of the bed, and nearly as deep as the roots go, and fork them out entire. Care is needed in doing this, as every bit left in the earth will grow, and give much trouble afterwards. The thin portions ("thongs") of the roots should be broken off, and the useable roots laid-in in some handy place out-of-doors, or stored away in sand under cover. Sets for future planting may be made from the straight bits of the thongs in the course of the winter. In preparing the sets, the small root-fibres should be rubbed off, to prevent the development of side-roots as far as possible, leaving about 2 inches at the bottom untouched. The sets may be cut 10 inches in length, and buried close together in the earth until wanted for planting. Ground for this crop should then be well manured and trenched, the dung being put at the bottom of the trenches.

JERUSALEM ARTICHOKEs.—The stems of these should now be cut down, and a sufficient quantity of tubers lifted for a fortnight's supply, and stable-litter or tree leaves strewn over those left in the ground.

POTATOS.—Tubers of the earliest varieties for forcing may be put into shallow boxes or pans filled with leaf-mould or any kind of light soil, placing the tubers 4 inches apart. Early *Potatos* may be forced in large boxes, &c.; but in any case the plants, when growing, should be kept close to the glass of the house or pit, and afforded air in sufficient amount to prevent the stems becoming drawn. Sets of the favourite early varieties may be spread out on leaf-mould or cocoa-nut fibre refuse in gentle heat to start them for planting out on hotbeds.

BRUSSELS SPROUTS, CABBAGES, ETC., will be benefited by having the dead and yellow leaves removed, which, if left on the plant, decay, and in the case of *Sprouts* injure them, besides affording hiding places for insects. *Pea* and *Bean* sticks may be pulled up, storing those which are still of use. Seed-pods of *Beans* should be gathered and dried. Collect fallen tree leaves which may have been blown amongst standing crops, as they occasion dampness by preventing free circulation of air. Sweep and roll paths weekly when made of binding gravel. *C. J. Waite, Glenhurst, Esher.*

FRUITS UNDER GLASS.

VINES IN POTS.—If the canes for pot-work have been treated as advised in former *Calendars*, and the bottom-heat bed remade with fresh *Oak* or *Beech* leaves, and turned over occasionally, so as to secure a steady warmth of 65° to 70°, the first important steps will have been taken. I prefer leaves to stable-litter and leaves, as if the quantity of the latter is large, the heat is apt to get too violent, and the roots to be injured. If at all dry, thoroughly moisten the mass of soil in the pots before plunging in the hot-bed. A temperature of 50° at night will be sufficient for the start, with 10° to 15° rise by sun-heat, the lesser degree being sufficient on sunless days. Damp the canes with tepid water several times daily, more or less, according to the state of the weather, and take care not to saturate the roots with water from the syringe, the watering at the commencement of forcing being usually as much as the plants need for a time, the bed itself giving off a large amount of moisture. Ventilation will be scarcely required for the next six weeks; indeed, our pot *Vines* are kept closer and a few degrees warmer than advised, this being necessary with our deficient sunlight, if ripe *Grapes* are required in March.

PERMANENT VINES.—These have been recently started, and the canes bent downward, to secure a regular break. If a small pit or house, with narrow inside borders can be devoted to these early *Vines*, it is of service, as then the large vineries need not be forced to the detriment of the *Vines*. If borders exist, the canes may be planted out to succeed

those in the pots, and afford a supply of fruit in April and May. The same kind of treatment as that afforded the pot Vines is suitable for these. If a layer of fresh leaves can be placed on the borders, much good is done by the warmth this affords and the moisture that is occasioned. I force these early Vines for two years, and then destroy them.

SUCCESSION VINERIES.—The Vine should be pruned at this season, and all necessary cleansing of the bark done. Do not scrape the Vines hard; it is a pernicious practice, and especially when a sharp knife is used for the purpose. Only the loose bark should be removed, and this is readily done by rubbing it with the hand. Wash the rods, after cleaning them, with warm water and soft-soap; and for mealy-bug, dress with Gishurst's Compound Soap. I have also used soluble petroleum mixed with clay with good results, but this must not be confounded with the ordinary paraffin of commerce, which is dangerous if not used with very great care. Gas-tar, if used in small quantities, is sometimes recommended as a winter dressing, but I do not advise its employment, it often doing more harm than good in inexperienced hands, especially to young Vines. When the pruning is completed, if the wood is at all soft, the wounds made with the pruning-knife should be dressed with styptic, and it is always advisable to do this when large branches have been cut out, or large old spurs removed. In houses where ripe Muscat Grapes are hanging, fire-heat must be sparingly used, and plenty of air afforded, to mature the young wood. If a crop of Black Hamburgh Grapes is required in the month of May, the vinery should be now got in readiness for starting the canes, the loose soil removed from the border, and replaced with fibrous loam, bone meal, or $\frac{1}{2}$ -inch bones and Thomson's Vine Manure mixed together. The Vines may be started in the first week next month. Other vineries, with ripe Grapes hanging, will need close attention, or the decay of the berries will set in rapidly. Keep the temperature in such vineries at 50° to 55° in dull weather, and try to have fresh air admitted to the house early in the forenoon, and to be enabled to do this, sufficient heat must be maintained in the heating apparatus to keep the temperature at night at the desired point. The bunches should be examined for decaying berries once weekly. Decaying leaves should be cleared away as soon as they part freely from the shoots, and the house kept as dry as possible. In cold weather 45° is sufficiently high. The Grape-room should be got in readiness for Black Hamburgh Grapes, which are better if they are cut, and placed in bottles during the course of next month. *G. Wythes, Syon House, Brentford.*

THE HARDY FRUIT GARDEN.

PLUM TREES.—These trees, when on walls, may now be pruned, and regulated if they are unequally balanced. In pruning the Plum, it is advisable to lay-in much young well-ripened wood, as on these the finest fruits are produced. There is no better mode of training Plums than the fan, as it is not only the best for the production of fruits, but for the renewal of branches where these have died or been cut out. The spurring-in of the weaker as also the strong shoots, especially foreright shoots, to two buds, should be carried out over all parts of the trees, and young wood neatly secured to the walls. Transplanting or part root-lifting should be resorted to in the case of strong-growing trees if unfruitful, a little fresh soil being scattered over the roots in re-planting, or if the staple is still in good heart the same will do without admixture. In pruning and regulating the roots, incisions should be made here and there to induce the growth of new roots. A sweet and moderately enriched soil, made firm about the roots, suits the Plum; and if a fair proportion of burnt earth or mortar rubble be added, so much the better in very stiff soils. Scale is one of the worst of Plum pests, and infested trees should be dressed occasionally with petroleum, water, and soapsuds or soft-soap, a safe proportion of petroleum being 1 gill to 4 gallons of suds; but for winter dressings the mixture may contain more petroleum with safety to the trees. *H. Markham, Mereworth, Maidstone.*

THE ORCHID HOUSES.

THE EAST INDIA-HOUSE.—The Butterfly Orchid, *Oncidium Krameriana* and *O. papilio*, are now in flower in this house. These two plants, almost more than any other, are remarked by visitors who have no special knowledge of Orchids; and for

amateurs, they should be amongst the first plants purchased, as being of easy growth and very free-flowering. I have grown them upon wood-blocks, on rafts, in baskets, pots and pans, but the last two I find to answer the best, and the ordinary plant-pot is as good as any; the plants should be afforded much light at all seasons, and during the winter they should be placed almost close to the glass. A moist place in the house and free root-waterings during growth are essentials. The only insect which is ever known to infest them is white scale, which if once allowed to remain on them long does much injury. These insects can be got rid of with a hard brush and soft-soap and rain-water; but the remedy will injure the plants if it has often to be had recourse to. The flower-spikes of *Phalenopsis* are now getting forward, although as yet no flowers have expanded. These Moth Orchids should now be watered with the greatest care, there being in the period from November to the end of February more than ordinary danger from affording them too much water; therefore keep them on the dry side. Occasionally weak guano-water, or farmyard drainage, may be afforded the plants. I have used more of the last-named manurial aid during the past season than ever before, and with good results. We should find *Phalenopsis* in better condition if fewer flowers were allowed to remain on small plants. Growers should, so soon as the flower-spikes begin to branch out, pinch out some of the branches, so that the flowers left may be large, and then there would be sufficient energy left in the plants to enable them to start away early in the growing season, and growth is always satisfactory when it is made early in the season. Where *Phalenopsis* are stood on stages with tables or stands under them, the latter should be syringed every morning once or twice if they are small of size, but much will depend upon the form of house and the position of the hot water-pipes. Plants of *Vanda Sanderiana*, which have finished flowering, should be rested by keeping them dry, but not too dry; and should the plants lose colour, or shrivel, water should be afforded quickly, as once a bad state of health is set up, a long time is lost in recovery.

Odontoglossum Roezlii is now growing fast, but much water must not be afforded the plant at the roots, else the small leaves on the current year's growth will be likely to turn yellow, and drop off. It is a plant which likes a very moist atmosphere, and those who have stove-houses will do well to place their plants of *O. Roezlii* in them, the general surroundings being there more in accordance with the requirements of the plant than the Orchid-house at this time of the year. The temperature for the different divisions should be about 60° to 63° for the East India-house, 58° for the Cattleyas, 55° for the intermediate-house, and 45° to 50° for the cool-house. *A. G. Catt, Parkfield, Hallow, Worcester.*

PLANTS AND THEIR CULTURE.

TROPEOLUM BALL OF FIRE.—This is an indispensable plant where cut flowers are required in large quantities during the winter season. It may be trained loosely on the rafters of the warm greenhouse, allowing it to hang about in a *négligé* fashion, which shows off its scarlet-coloured flowers very prettily. The plants may be grown in pots of 10 or 12-inches in diameter, according to the size the plants are required to make; and the compost may consist of fibrous loam three parts, leaf-soil one part, and sufficient silver-sand to keep the whole mass porous.

JASMINUM GRANDIFLORUM.—This is a most useful plant for flowering in the winter, and whose blooms last a long time after being cut from the plant. Grown in smallish pots, it is a very useful subject for standing in apartments, but I always find it to be the most useful when planted out in narrow borders in a mixture of three parts good fibrous loam, one of peat, with some small portion of sand, when it will continue to bloom the whole winter.

LINUM TRIGYNUM.—This is another valuable plant in the winter season, grown either in pots or planted out in the conservatory border. Where the latter plan is adopted, it affords plants of large size, but I prefer to grow it in pots, as the plants are not then so liable to be infested with red-spider, which soon spoil the look of the foliage, if they are allowed a foothold for only a short space of time. Plants grown in pots should be assisted occasionally with weak, clear soot water, which imparts a rich green colour to the leaves, causing them to contrast agreeably with the bright yellow flowers.

BIGNONIA CHIRERE.—This plant, when well grown, gives abundance of flowers from this time until the end of January, and is one of the best plants we have for training on pillars, covering walls, &c.

WINTER-FLOWERING BEGONIAS.—The different species of the *Begonia* suitable for blooming during the winter months, and which have been grown on as advised in previous Calendars, will now furnish a good supply of blossoms. It is good practice to introduce half of the stock of these plants into a house having a little higher temperature than the one they have hitherto occupied some three weeks before the remainder, as by so doing there will a longer succession of blooms obtained. Let the plants have all the light possible, and apply weak manure water frequently, which will greatly increase the size of the blooms and trusses. Many of the late-sown seedlings of *B. tuberosa* will continue to bloom for some time longer if they are kept in light positions, and care taken not to afford them much water. *R. Milner, Penrice Castle, Swansea.*

THE FLOWER GARDEN.

HERBACEOUS BORDERS.—Any remaining old flower-stems should be cut down to within a few inches of the ground, and put a light dressing of short manure between the plants, and point it into the ground with a five-tined fork. Take care not to go deep enough to injure bulbous and other plants whose stems have died down naturally. A surface-dressing of leaf-mould might also be applied with advantage to the occupants of the borders.

HARDY FERNERIES.—In most gardens shady, and perhaps objectionable nooks, may often be found, that might be rendered interesting and beautiful spots, by using old roots, logs, butts of trees, rugged stones, clinkers, or burrs from the brick-yard, and planting some Ferns. In placing the materials, observe that each block of wood or stone recedes instead of projecting, so that the plants in the interstices may derive full benefit from rain. Avoid at the same time formality of outline and surface. When completed, the following varieties may be planted:—*Allosorus crispus* (Mountain Parsley Fern), *Asplenium adiantum nigrum* (Black Maidenhair Spleenwort), *A. trichomanes depauperatum*, *Athyrium filix-femina* (Lady Fern), *A. f.-f. crispatum*, *A. f.-f. dissectum*, *A. f.-f. Fieldiae*, *A. f.-f. furcillatum*, *A. f.-f. gracile*, *A. f.-f. multifidum nanum*, *Blechnum spicatum* (common hard Fern), *B. imbricatum erectum*, *Cystopteris alpina* (Alpine Bladder Fern), *Lastrea cristata* (Crested Buckler Fern), *L. filix-mas* (male, or common Buckler Fern), *L. f.-m. Daddii*, *L. f.-m. furcans*, *L. f.-m. grandiceps*, *L. polydactyla*, *Osmunda regalis* (Royal Fern), *Polypodium dryopteris* (Oak Fern), *P. hibernicum* (Irish Polypody), *Polystichum aculeatum* (common prickly Shield Fern), *P. angulare* (soft prickly Shield Fern), *P. angulare cristatogracile Jacksonii*, *Scolopendrium vulgare* in variety. In planting, make the soil moderately firm about the plants, and give water to settle the soil about the roots.

GENERAL WORK.—This consists of the cleaning up of fallen leaves, the rolling of lawns, repairing and re-gravelling of walks and roads, the levelling and relaying of turf, mulching Rose-beds where not already done, &c.

BEDDING PLANTS.—Where there is no better accommodation than cool-pits provided for the wintering of Pelargoniums, great care is necessary to save even one-third of the autumn-struck plants from damp. Therefore, plenty of air should be given on all favourable opportunities to dry the plants and their surroundings; and with this object in view, a mixture of lime and soot might with advantage be deposited among the plants, and between the latter and the brickwork. A covering of Fern and mats, or other protecting material, must be put over the glass at night, to prevent frost from reaching the plants. Give plenty of air during mild weather to frames in which *Calceolarias*, *Pansies*, and *Leucophytons* are growing. Should mildew make its appearance on *Verbenas* or other plants, lose no time in dusting over the affected leaves, while damp, with flowers-of-sulphur. Bedding-plants being wintered in Vineries, Peacheries, and other heated structures, should also have abundance of air, and be kept on the dry side at the roots, to prevent them from making growth before spring. *H. W. Ward, Longford Castle, Salisbury.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY,	DEC. 3—	Linnean Society.
FRIDAY,	DEC. 4—	Dundee Horticultural Association.
SATURDAY,	DEC. 5—	Preston and Fulwood Horticultural Society.

SALES.

MONDAY,	Nov. 30—	Dutch Bulbs, at Protheroe & Morris' Rooms. Important Sale of Nursery Stock, at the Nurseries, Richmond, Surrey, by Protheroe & Morris (four days). Dutch Bulbs in large quantities, at Stevens' Rooms.
TUESDAY,	DEC. 1—	Lilies, at Protheroe & Morris' Rooms.
WEDNESDAY,	DEC. 2—	Azaleas, Palms, Roses, &c., at Protheroe & Morris' Rooms. Roses, Fruit Trees, and Border Plants, at Stevens' Rooms.
THURSDAY,	DEC. 3—	Dutch Bulbs, at Protheroe & Morris' Rooms. Roses, Fruit Trees, and Border Plants, at Stevens' Rooms.
FRIDAY,	DEC. 4—	Imported Orchids from Sander & Co., at Protheroe & Morris' Rooms.
SATURDAY,	DEC. 5—	Dutch Bulbs at Protheroe & Morris' Rooms. Liliums, Gladioli, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41° 3.

Horticultural Education.

WHILE the subject of technical education in Horticulture is occupying so much attention, we are pleased to be able to lay before our readers the views entertained on the subject by so highly competent an authority as the Director of the Royal Gardens, Kew:—"You ask me to communicate to the pages of the *Gardeners' Chronicle* something on the subject of Horticultural Education. This is undoubtedly a compliment, seeing that it obviously involves the not inconsiderable assumption that I know something about it, or, at any rate, have something to say on the subject which may be worth attention.

I am by no means unwilling to do what I can. But though my own opinions on the matter are tolerably clear, the various aspects in which the question presents itself at the moment are, to tell the truth, a little mixed. One has got to fix distinctly in one's mind whom, in the first place, one proposes to educate, and with what object. Some of my friends say gardeners; others "younger sons;" and here I am reminded that the ladies must not be forgotten. Others, again, insist that intending colonists are the people to be taken in hand; some, on the other hand, suggest that the future peasant-proprietor is the person to be looked after with an eye to fruit-culture and the *petite culture* generally. Lastly, there are those who would be content to disseminate a general interest in the subject by peripatetic and popular lectures, addressed to any local audience that may be inclined to attend them.

It will be admitted that we have here a rather large field for discussion, and, unless we settle

what particular item we are taking in hand, I have found that we are apt to get rather at cross-purposes.

I had got as far as this in the sorting out of my ideas, when the August number of the *Agricultural Gazette* for New South Wales came into my hands. Here I found a letter from Professor HUXLEY on a subject closely analogous, which struck me as altogether admirable. It has made a boomerang-like flight to the Antipodes, and back again. But it is evidently none the worse for the journey, and I do not see why I should not launch it on its travels again:—

In the course of a paper on technical education, before the Easingwold (England) Chamber of Agriculture, on April 10 last, Mr. J. HARRISON read the following letter from Professor Huxley, which appears also in the *Agricultural Gazette* of England:—"I am afraid that my opinion upon the subject of your enquiry is worth very little, my ignorance of practical agriculture being profound. However, there are some general principles which apply to all technical training. The first of these, I think, is that practice is to be learnt only by practice. The farmer must be made by thorough farm work. I believe I might be able to give you a fair account of a Bean plant, and of the manner and condition of its growth; but if I were to try and raise a crop of Beans, your club would probably laugh consumedly at the result. Nevertheless, I believe that your practical people would be all the better for the scientific knowledge which does not enable me to grow Beans. It would keep you from attempting hopeless experiments, and would enable you to take advantage of the innumerable hints which Dame Nature gives to people who live in direct contact with things. And this leads me to the general principle which I think applies to all technical teaching of schoolboys and schoolgirls, and that is, that they should be led from the observation of the commonest facts to general scientific truths. If I were called upon to frame a course of elementary instruction preparatory to agriculture, I am not sure that I should attempt chemistry, or botany, or physiology as such. It is a method fraught with danger of spending too much time and attention on abstraction and theories, on words and notions, instead of things. The history of a Bean, of a grain of Wheat, of a Turnip, of a sheep, of a pig, or of a cow, properly treated, with the introduction of the elements of chemistry, physiology, and so on, as they come in, would give all the elementary science which is needed for the comprehension of the processes of agriculture in a form easily assimilated by the youthful mind, which loathe anything in the shape of long words and abstract notions, and small blame to it. I am afraid I shall not have helped you very much, but I believe that my suggestions, rough as they are, are in the right direction.—Yours, &c.,

"(signed) T. H. HUXLEY."

Now, with every word of this, I, for my part, cordially agree. It is just what I meant to say, only said a great deal better. I do not propose to employ it as a stalking-horse, but I am glad to use as a text for some further observations on a future occasion a piece of sound, vigorous common sense. *W. T. Thiselton-Dyer, Royal Gardens, Kew.*

LINNEAN SOCIETY.—An evening meeting will be held on Thursday, December 3, at 8 P.M., when the following papers will be read:—1, "A Contribution to the Freshwater Algae of the West of Ireland," by W. WEST, F.L.S.; and 2, "The Tick Pest in Jamaica," by Dr. W. H. W. STRACHAN.

"ICONES PLANTARUM."—The third series of HOOKER'S *Icones Plantarum* (vols. xi—xx of the whole work) is now complete, and the BENTHAM trustees, who are continuing the work under the editorship of Professor D. OLIVER, are offering a limited number of sets of this series of ten volumes

for five pounds the set. It contains figures of a thousand new plants, including the most interesting discoveries of the last thirty years, and the most striking of the new genera described by BENTHAM and HOOKER during the progress of their *Genera Plantarum*. As the whole impression consists of only 250 copies, the work will soon become un-purchasable. Thanks to the provision made by the late Mr. BENTHAM, the trustees are issuing a fourth series at the rate of one volume of 100 plates annually, at the very low price of sixteen shillings. Persons wishing to secure a copy of the third series should apply at once to DULAN & Co., 37, Soho Square, W.

ALPINE PLANTS.—M. CORREYON is about to publish, through M. KLIENSTOCK, of Paris, an *Iconographie des Plantes Alpines*, and *Les Plantes des Montagnes*.

"REICHENBACHIA."—The last issued part surpasses its predecessors, even in the artistic beauty of its plates. The figures of *Lælia purpurata*, *Selenipedium nitidissimum*, and *Cattleya labiata* (MENDEL'S var.), are very fine illustrations alike of the talent of the artist and the skill of the chromo-lithographer. Mr. ROLFE is responsible for the botanical portions of the text.

Lælia purpurata, *Reichenbachia*, tab. 25.

Masdevallia Harryana splendens, *Reichenbachia*, t. 26.—This magnificent species is a native of the Eastern Andes, at heights from 7000 to 10,000 feet, spreading in uninterrupted masses for miles, covering acres upon acres of the upland slopes, growing in the partial shade afforded by the low shrubs that abound in the place. When in flower, these masses of *Masdevallias* are said to present one of the most striking floral sights which it is possible to behold. The species is extremely variable in colour. The one now figured is remarkable for the large size and deep purple colouring of the flowers. It is distinguished from *M. coccinea* mainly in the fact that the dorsal sepal is always reflexed in *Harryana*, whilst in *coccinea* it is never so.

Selenipedium hybridum nitidissimum, t. 27.—A hybrid raised by Mr. COOKSON out of the rosy variety of *S. caudatum* by pollen of *S. conchiferum* ×, the latter a hybrid out of *S. caricinum* by *S. Koezlii*. It is a bold, handsome, free-flowering variety.

Cattleya Mendeli var. *Measuresiana*, t. 28.—A truly superb form of *C. labiata*, grandly represented by Mr. MOON. The species, especially the finer varieties of it, are getting rare in their native localities—a fact hardly to be wondered at on looking at this fine plate. Messrs. SANDER have lately paid £200 for a single specimen growing on a tree.

A TRIPLE TROPHY WINNER.—At the Barnstaple and North Devon Autumn Fruit and Flower Show, held on November 3 and 4, Mr. Wm. HARRIS, the gardener to T. J. DENNIS, Esq., Bradford House, Barnstaple, was successful in winning the Silver Cup for the best collection of Grapes, this being the third time in succession that he has won this trophy.

POISONING BY WEED KILLER.—We have another fatality to add to those already recorded in consequence of the careless use of "Weed-killers." In this case a man died from partaking of Gooseberry wine stored in a cask which had previously contained weed-killer. As a result of the analysis, it was stated that the cask contained enough arsenic to kill 3000 adult persons! It is quite evident that much more stringent precautions should be taken in the sale and in the use of these preparations than is at present done. We know that it is almost impossible to gauge the extent of human folly and carelessness, but if the sale and purchase of these dangerous substances were hedged in by a few wholesome obstacles, the results would not be so lamentable.

CARDIFF CHRYSANTHEMUM SHOW, NOVEMBER 18, 19.—The fifth annual exhibition took place in the Park Hall, and notwithstanding the

wretched weather of the first day, there was on the whole a very fair attendance of visitors to the show. In the open classes, Mr. S. TRESSEDER, Cardiff, won easily, and in addition to taking 1st prizes for a group, and for twenty-four blooms, he secured the Certificate of Merit, and the Silver Medal of the National Chrysanthemum Society. Mr. F. CAASE, Cardiff, was 2nd for a group in the open class; he was also 1st with wreaths, crosses, and bouquets. Table plants were very numerous, and those having coloured foliage were very bright looking: 1st, Mr. A. CURRY, gr. to E. M. HANN; and Mr. T. CLARK, gr. to Colonel Hill, was 2nd. Besides the show of Chrysanthemum plants and blooms, there were exhibited plants of the stove and greenhouse, collections of Pears, Apples, Grapes, &c. The entries in

Titan is more like a ball of ostrich feathers than a flower, and is exceedingly lovely. In contrast to this might have been seen some varieties hardly larger than Immortellea.

GARDENING AT MALAGA.—The British Consul at Malaga, reporting on the trade of the consular district, and referring to openings for British commerce, says:—"There is also room for one or two really good English nursery gardeners, who will do their work systematically. There is a great demand to go on as their fathers did before them. Quantities of flowers are sent away to places inland and to Madrid; but the plants once in the ground, are allowed to do much as they please, and, thanks

MR. HIBBERD'S BOOKS.—Messrs. W. H. & L. COLLINGRIDGE, the proprietors of the *Gardeners Magazine* (the editorship of which was under the late Mr. SHIRLEY HIBBERD), have purchased of the Receiver of the estate of Messrs. Groombridge & Son, Limited, the whole of the stock, copyright, engravings, and stereotype plates of the well-known gardening books by the late Mr. SHIRLEY HIBBERD; and will in future supply the trade. Many of the books are at present out of print, new editions of these are in preparation:—*Brambles and Bay Leaves*; *Field Flowers, a Handy book for the Rambling Botanist*; *Profitable Gardening, a Practical Guide to the Culture of Vegetables, Fruits, &c.*; *The Amateurs' Greenhouse and Conservatory*, *The Amateurs' Flower Garden*, *The Amateurs' Kitchen Garden*, *The Amateurs' Rose Book*,

FIG. 93.—ABRAHAM HALL, CAMBRIDGESHIRE. (SEE P. 648.)

the cottagers' classes were fairly numerous, and the exhibits generally of good quality.

A CHRYSANTHEMUM SHOW IN PARIS.—A Chrysanthemum show, which opened on Thursday, November 19, on the premises of the National Horticultural Society of France, says *Galignani's Messenger*, was extremely interesting. The principal exhibits came from the north and south of France, and were widely dissimilar. Those of the north were remarkable for their size, some of them being 8 inches in diameter, or as large as an ordinary Sunflower, whilst those from the south were mostly small varieties, and were noticeable for curious combinations of delicate colours and eccentric shapes. Perhaps one of the most beautiful had a golden heart fringed with gold. The

to the wonderful climate, where the Norway Fir and the Palm tree grow side by side, they do not deteriorate for some time. A gardener coming out here with a small capital ought to do well.

TECHNICAL EDUCATION.—The Government of New South Wales is publishing a series of works useful to the cultivator. Among them we find the second edition of Mr. MAIDEN'S *Treatise on Wattles and Wattle Barks* (*Acacia* sp.). It contains figures of the most useful species, indications of their chemical constitution, and directions for their cultivation, and the conservation of the trees, which are of great commercial importance for their bark, which is largely used in tanning. The first edition of 2000 copies was applied for in less than six months. The present edition is practically a new work.

The Book of the Aquarium; *The Fern Garden: how to make, keep and enjoy it*; *The Ivy: its History, Uses and Characteristics*, *Rustic Adornments for Homes of Taste*; *The Sea-weed Collector: a Handy Guide to the Marine Botanist*; *The Town Garden: a Manual for the Management of City and Town Gardens*.

RHODODENDRONS BLOOMING IN NOVEMBER.—As witness of the mildness of the season, says the *Scottish Leader* of the 21st inst., a correspondent had sent from Spitalhaugh, Sir JAMES FERGUSON'S place in Peeblesshire, a twig of *Rhododendron* bearing a flower-bud. The florets were fully formed, with their large stamens rolled up within. The grounds at Spitalhaugh are thickly planted with *Rhododendron* shrubs, all of which are budding in the same way.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner of the above society is fixed for Tuesday, December 1, at Auderton's Hotel, Fleet Street, at 6.30 P.M., Mr. ROBERT BALLANTINE, the chairman of the committee, presiding. The early winter exhibition of Chrysanthemums, which takes the place of the mid-winter show formerly held in January, will be held at the Royal Aquarium on Wednesday and Thursday, December 9 and 10; and the Floral Committee will meet at 2 P.M. on the first day.

PUBLICATIONS RECEIVED.—A pamphlet on *Carnations and How to Grow Them*, from Mr. GEORGE PIPPEN, Reading, Berks.

PLANT PORTRAITS.

ARISEMA EUNEAPHYLLUM, *Garten Flora*, p. 579.

BEGONIA MDLLE. EMILE RODIGAS.—A tuberous Begonia of dwarf habit, and nearly circular flat flowers of a crimson-scarlet colour, and nearly 7 inches in diameter. It was raised by MM. Blancquaert and Vermeiren, of Ghent. *Illustration Horticole*, t. 137.

CALADIUM SAGITTATUM.—A variety with sagittate leaves of a deep green colour, picked out with crimson along the principal nerves. *Illustration Horticole*, t. 138.

CYCNOCHES PERUVIANUM.—A Peruvian form introduced by the L'Horticulture Internationale. It is a male plant allied to *C. ventricosum*, but quite distinct in colour, being light green, with numerous small brown spots, and with a white lip. *Lindenia*, t. 301.

CYPRIPEDIUM AMABILE X.—A cross between *C. javanicum-superbiens* and *C. Hookeræ*. Would it not have been preferable to give a plant with such an origin a garden name? *Revue Horticole*, Nov. 1.

DAIS COTINIFOLIA, *Garden*, October 31, 1891.—A South African *Daphne*, which would form a serviceable greenhouse plant if it could be propagated readily.

IRIS KOBOLKOWI (REGEL) VAR. *VENOSA*.—Flowers dull lilac, and purple veins. *Garten Flora*, t. 1358, November.

LAELIA AMANDA X.—A presumed natural hybrid between *Cattleya intermedia* and *Laelia crispata* or *L. purpurata*. It was introduced by Mr. Bull in 1882, and described in *Gardeners' Chronicle*, 1882, xviii., p. 776. *Illustration Horticole*, t. 135.

LAELIA PURPURATA VAR. *ROSEA*.—Sepals and petals, rose-lilac. *Lindenia*, t. 302.

LILIUM HENRII, *Garden*, Nov. 7, 1891; see also *Gardeners' Chronicle*, vol. viii., p. 380, 1890.

LONICERA TANGUTICA, *Garten Flora*, p. 581.

MILTONIA REGNELLI PURPUREA, *Revue de l'Horticulture Belge*, November.

ODONTOGLOSSUM EDWARDI, *Orchidophile*, August.

PHALENOPSIS VIOLACEA.—A Sumatran species. The flowers vary from violet to creamy-white, with the segments sometimes barred and spotted. *Lindenia*, t. 303.

PLUM, YELLOW MONSIEUR, *Bulletin d'Arboriculture*, p. 257.

SELENIPEDIUM CALURUM X.—A hybrid, raised by Mr. Seden, out of *S. longifolium* by Sedeni. Mr. Rolfe gives an interesting history of this and allied hybrids. *Lindenia*, t. 304.

STEMONITIS ELEGANS, sp. n.—A new Mexican Fern, discovered by Pringle. The fronds are 6 to 16 inches long, glabrous; are cordate, deeply palmately 5-lobed, lobes lanceolate, central one larger than the others. Petioles chestnut brown. *Garden and Forest*, Oct. 14, 1891.

STENANDRIUM LINDENI.—A Peruvian species of dwarf habit, oblong-green leaves, the central and principal side nerves marked out with yellow blotches, flowers yellow in close erect spike. Acanthaced. *Illustration Horticole*, t. 136.

BABRAHAM HALL.

THE county of Cambridgeshire cannot be regarded as rich in the number of its fine mansions, or extensive private gardens, and the above demesne ranks as one of the best in the county. It is situated some 7 miles to the south-east of Cambridge in the village of Babraham, at the foot of the Gog and

Magog Hills, and is the residence of Charles Robert Whorwood Adeane, Esq., J.P., who is lord of the manor and sole landowner. The mansion is an Elizabethan structure, built of red brick with stone facings, and it is pleasantly situated in a fine park of some 200 acres in extent. This mansion was built in the year 1832, by Henry John Adeane, Esq., grandfather to the present owner. One of the possessors of the old mansion which was demolished, Sir Horatio Palavicini, figures in English history as a collector of Papal taxes during the reign of Queen Mary; and he is said to have been a purloiner of these taxes, and who, after the death of the queen, is said to have taken up his residence here from 1576 to 1600. There is a curious epitaph in Walpole's *Anecdotes of Paintings*, which throws some light upon this gentleman's position and character; it runs as follows:—

"Horatio Palavicini,
Who robb'd the Pope to lend the Queen,
He was a thief,—a thief? Thou liest!
For where? He robb'd but Antichrist,
Him Death with besom swept from Babraham,
Into the bosom of Old Abraham."

The old mansion was pulled down in the year 1765. The gardens are not very extensive, and at the time of my visit I found them in very good keeping, the kitchen garden being especially well cropped. The wall trees had been allowed to go somewhat astray, and these Mr. Hills, the gardener, has replaced in many instances with better varieties. I was told that the gardens suffer much in dry weather, owing to the soil being gravelly, and resting on chalk. Mr. Hills' method of protecting his Strawberry fruits from the slugs and dirt is of interest, and may be worthy of consideration by others; the plan is simple, but effective. He places three rough sticks in the ground around the plant, tying a piece of matting from one to the other, and places the bunches of fruit thereon; and he told me that his plan is perfectly satisfactory, which is more than can be said of some other methods of keeping the slugs away from the fruits. I have seen in other establishments wires stretched along each side of the rows of very long plantations, and the fruit laid upon them, but this was not so satisfactory, as some of the stalks which grow between one plant and another in the rows could not be placed upon these wires.

About 300 Chrysanthemums are grown of the leading varieties. The flower-garden beds were planted with the usual bedding-out plants, 10,000 of which are required to fill them. Standing on the lawn is a unique specimen of the *Asplenium-leaved* Beech (*Fagus sylvatica* var. *asplenifolia*).

The conservatory is small, and at the time of my visit was tastefully furnished. *Franea ramosa* is much grown for indoor decoration, for which purpose it is a very suitable subject. The lawn at Babraham, like those in most old gardens, was beautiful in its soft yielding surface and perfect verdure, and it evidently receives much care from the present gardener, W. Harrow.

EFFECTS OF FOG ON PLANT-LIFE.

THE members of the Manchester Field Naturalists' and Archaeologists' Society held their autumn *soirée* on Thursday, Nov. 19, in the Memorial Hall, Albert Square. Dr. G. H. Bailey, of the Owens College, said he proposed to confine himself to one very narrow corner of the subject of air-impurities, viz., fog. In Manchester and other large towns, after sunset was the warmest part of the day. Frequently we had a chilly day until 4 or 5 o'clock, and about 6 o'clock it became quite warm and quiet. For some three or four months now he had taken a record which confirmed his impression on this point. They had almost as many bright nights in Manchester as they had dull days. Proceeding to deal with the question of fogs, Dr. Bailey spoke of the great increase that had taken place in their number, not only in Manchester, but in London and other large

towns. He had been asked this question: Supposing they got rid of the coal-dust, what would they do with the sulphurous acid, which was probably more injurious than the coal-dust? It was perfectly true that the sulphurous acid was more injurious than the coal-dust. But did the sulphurous acid trouble us in the summer? No. The reason it troubled us in the winter was, because the smoke prevented it from getting away. Clear the atmosphere of smoke, and you cleared away the sulphurous acid too. If there was one point more important than another in connection with this matter, it was the amount of organic matter present in the air. In such a fog as we have already had this winter, the amount of organic matter was at least ten times that which was found in the ordinary air of the city. The amount of sulphurous acid increased in about the same proportion. The most recent experiments that had been set on foot were those which had for their object the determination of the extent to which the light was interfered with by the overhead accumulations. The amount of light varied a good deal according to the season of the year, the amount received in November being only about one-tenth of that received in September. But still more striking was the effect of the fog on light. The fog shut off the light almost completely, and the record in the country was fifteen to twenty or thirty times over that in a large town. With the aid of the lantern, Dr. Bailey threw on a screen curves showing the mortality in Manchester in different parts of the year. These showed that the mortality figures were exceptionally high during the prevalence of fog, and especially so in respect of diseases of the respiratory organs. At the same time, he admitted that the increase might be to some extent due to the cold.

It was often asked, he said, what could be done to remedy all this. Mr. Bailey thought he might prophesy that ere long we should be lighting by electricity and heating by water-gas, and then we shall be able to dispense with such things as fogs. There were plenty of other remedies that would be forthcoming when they were seriously asked for.

Professor F. W. Oliver, of University College, London, afterwards testified to the enormous havoc wrought by fog in urban and suburban districts amongst cultivated plants. The general gross features of the injuries were illustrated by a comprehensive series of coloured lantern-slides. Amongst them were faithfully portrayed the lesions to flowers and foliage with which horticulturists are only too familiar. In alluding to the impurities which are present in the air of large towns, sulphurous acid was specially indicated as the source of much of the damage; it has an immediate effect upon young unprotected leaves, and upon the flowers and buds of greenhouse plants. It attacks the living cells, not only at the surface of the organs, but also from within, obtaining access to the system of lacunæ, which everywhere penetrates them. Such is the inference to be drawn from the observed facts. The actual deposits which collect upon the foliage, even of hot-house plants, contribute also to the destruction; though experiment showed that the carbon, and the red and magnetic oxides of iron, were relatively innocuous, the sulphuric acid and metallic iron had in time a corroding action. This is seen in the gradual death and discoloration of the epidermal tissues of the upper surface of the leaf which is immediately in contact with the deposit—even in cases in which the direct poisonous action of the sulphurous acid had been resisted. Whether and to what extent the hydrocarbons, sometimes present to the extent of 10 or 12 per cent., contribute to the damage was not yet determined, as the investigation of this point was incomplete. The reduction of light which accompanies the fogs is a contributing factor which must not be neglected. Even if there were no impurities in a foggy atmosphere in any way harmful to plants, there would still be a very free dropping of foliage in many instances, if this reduction of light were so considerable, and so long maintained as was the case last winter. Not only did the

fog screen the plants from light whilst it lasted, but even when intervals of clear weather occurred, the thick deposits left on the glass would interfere with proper illumination. This was forcibly illustrated by an actual square of glass, cut from a London Orchid-house at the conclusion of the fogs of February last, which was projected upon the lantern-

tion current could be demonstrated. A practical gardener would at once grasp the fact that under such conditions great care must be exercised against overwatering the plant. Further, since a high temperature promotes increased activity of absorption by the roots, and at the same time exaggerates the poisonous effect of sulphurous acid, it is desir-

COUROUPITA GUIANENSIS, CANNON-BALL TREE.

A CURIOUS-LOOKING tree, often met with in woods and pastures. The peculiarity is principally due to the mode in which the flowers are borne on long branches, which grow from around the trunk, com-

FIG. 24.—CANNON-BALL TREE: COUROUPITA GUIANENSIS.

screen. In conclusion, the lecturer indicated the sulphurous acid and the great reduction of light as the two chief factors in the destruction. In addition to its action already alluded to, sulphurous acid arrests transpiration, a condition likewise promoted by want of light. Even when a plant was exposed to an exceedingly dilute atmosphere of sulphurous acid, which might be too weak to actually kill its cells, a marked interruption of the transpira-

able to keep the temperature of a greenhouse in foggy weather as low as is consistent with the safety of the collection. By paying attention to these two common-sense principles, a gardener might hope to mitigate, in some degree, the damage that might be caused. This treatment would favour the plant in its struggle against both of the adverse conditions—want of light, and presence of sulphurous acid.

menting at its base, and continuing many feet upwards. The flowers are arranged in terminal racemes, and fall soon after expanding, the peduncle and rachis, however, instead of falling or withering, hardens and enlarges, producing its racemes in succession at its extremity each season. Years afterwards the woody pedicels may be seen still upon the flowering branches. So rarely does the arrangement of these latter resemble a creeping plant growing

upon a tree, that it is difficult to convince people it is quite an illusion, and that they bear the flowers of the tree themselves. In colour, the large cup-shaped flowers are red inside, yellowish-white outside; they measure 4 inches across. The large brown ball-shaped fruits (see fig. 94), unlike the fragrant flowers, emit a disgusting odour, rivalled only by the flowers of *Terminalia Belerica*. This latter tree, when in flower, fills the atmosphere throughout the garden in a way which suggests to the uninitiated that the sanitary arrangements of the district are in a very bad condition, and visitors are often deceived, and conclude such actually to be the case.

The *Couroupita* forms itself into a large tree some 50 to 60 in height, and bears a dense mass of shining green leaves, becoming deciduous once, or sometimes twice, during the year. The leaves on these occasions fall very rapidly, and are replaced again in a few days by a new set. *W. E. Broadway, Royal Botanic Gardens, Trinidad.*

TOWN FOGS, AND THEIR EFFECTS.

(Concluded from p. 605.)

ARTIFICIAL LIGHT.—As regards fog and artificial light, Mr. Livesey tells me, that if a dense fog covered London all day, the additional gas consumed would be 30 million cubic feet; but so extensive a fog probably never exists—certainly not all day, so the amount of gas may be correctly reckoned at 25 million cubic feet; and if the cost of this be 2s. 6d. per 1000 cubic feet, it amounts to £3125. As a standard of comparison, I should state that the total consumption of gas in the London district per day of twenty-four hours in depth of winter is 140 million cubic feet.

Fogs cannot be prevented from forming over towns; there are inducements in the way of dust particles and products of combustion for fogs to form there, but whether they must always be so black and loaded with soot and tarry matter is another question. As long as coal is burnt there will be dense fogs.

EFFECTS OF FOG ON PLANTS GROWN IN THE HOUSES AT KEW.

The heavy fogs injured many plants. The leaves fell off, the growing point withered, and in some cases, such as *Begonias* and *Acanthads*, the stems also were affected. Flowers fell off as soon as opened, or in bud. Almost all expanded blooms were less in size than when there was no fog. Flower-buds of *Phalænopsis*, *Angræcum*, some *Begonias*, *Camellias*, &c., changed colour and fell off, as if they had been dipped in hot water.

In the Palm-house, bushels of healthy-looking leaves were gathered up almost every morning. Plants which appeared perfectly healthy, when shaken would drop almost every leaf. Herbaceous plants suffered most, *viz.*, *Begonias*, *Poinsettias*, *Bouvardias*, *Acanthads*, &c. Some herbaceous plants were uninjured, *eg.*, *Cyclamen*, *Primula*, *Hyacinth*, &c. Many hard-wooded plants lost their leaves and were otherwise damaged, *viz.*, *Boronia*, some *Heaths*, *Grevilleas*, *Acacias*, &c. *Protea cynaroides*, a Cape plant, with large laurel-like leaves, was much injured in the temperate-house (min. temp., 40°), the leaves turning black, as though scalded. The same species in another house, with drier atmosphere and higher temperature, was scarcely affected by fog. As a rule, plants in active growth suffered most. Monocotyledonous plants and Ferns were mostly uninjured, except by the low temperature of the winter. The effect of fog on flowers is remarkable; generally white flowers are destroyed, but there are notable exceptions, *viz.*, *Masdevallia tovarensis*, *Odontoglossum crispum*, and *Angræcum* amongst Orchids; and *Cribiums*, *Cyclamen*, *Hyacintha*, *Chrysanthemums*, &c. The green leaves of *Poinsettia pulcherrima* all fell off, the red bracts remained on, also the flowers. Buds of white-

flowered *Angræcum sesquipedale* turned black, as if boiled; those of *A. eburneum* (also white) were unharmed. These two were grown in same house, under same conditions, and bloomed about the same time.

The conditions most conducive to rest from growth, *viz.*, a low temperature and moderately dry atmosphere, and diminished light, unavoidable during fog, were proved at Kew to be safest for all plants during prevalence of heavy fogs. *W. Watson.*

[Various methods have been proposed to mitigate the effects of fog. The plan adopted at the House of Commons of filtering the air through thick layers of cotton-wool is one. Mr. Toope, of Stepney Green, has also put up a house which is nearly air-tight (fig. 95), the air being compelled to pass through inlets, where it is deprived of its objectionable ingredients, and passes out at the top of the house by special "exhaust caps," which admit of no down draught. The house is heated by a steam-pipe, and the heat can be regulated at will, as also the quantity of air admitted through the inlets. In this house, which is in two com-

FIG. 95.—TOOPE'S FOG-RESISTING HOUSE.

partments, one cooler than the other, Mr. Toope has at this time a miscellaneous collection of small Orchids, with some *Chrysanthemums* and other plants, the whole doing well, in spite of the unfavourable surroundings. We hope to visit Mr. Toope's house again after a few months, "fog permitting," and to report the result. *Ep.]*

HOME CORRESPONDENCE.

THREE GOOD VARIETIES OF VEGETABLES.—Being in Banbury on the 18th, and finding it was the *Chrysanthemum* Show day, I thought I would just have a "look-in" and see what sort of a show they manage to hold in that town. I am not going to trouble you about the *Chrysanthemums* and the principal exhibits there, but as one knowing the interest centred upon anything "good," there were three vegetables exhibited there, so superior to those generally seen, that I felt it incumbent upon me to make a note of, as being three items that would, I feel sure, be appreciated by all first-class cultivators. The first of these is the Oxonian Leek (11 inches round), raised, I was informed, by Mr. G. T. Miles, of Wycombe Abbey Gardens, and evidently a grand variety to be noted by Leek growers as being one of the best for general purposes. The second was Aylesbury Prize Red Celery, which, I hear, is the result of fifteen years' careful selection by Mr. H. Wingrove, of Rousham Park fame; and last, but not least, I would mention the grand Onion which secured the first honours, not only at Banbury, but also at the Royal Horticultural Society's Show at South Kensington, and which I remember came in second (beaten by its comrade Ailsa Craig), at the International Show, Edinburgh. As shown at Banbury it is unquestionably a magnificent Onion—a better one could not be wished for. I have simply mentioned the above three for the information of cultivators on the look-out for something "out of the common" in vegetables, and would certainly advise any gardener who has to produce for his employer's tables some "fine vegetables," to afford the above a trial. *Pioneer.*

CHRYSANTHEMUM ETOILE DE LYON.—I cannot see so much to take one's fancy in this now much grown variety. If one wants an immense flower, all well and good, but, to my mind, it is not all a good *Chrysanthemum* bloom should be. Definite colour, good form, and good substance in petals is what, I think, are most desired, and these qualities, I maintain, are deficient in *Etoile de Lyon*. In the first

place, as to colour: I have seen it white, sometimes of a dirty white, and at others quite a deep pink; and as to good form, it lacks depth and body. *G. Ward.*

VEITCH'S MATCHLESS CARROT.—To those who have not tried this variety, I would say, do so at once. It is alike valuable for exhibition and table use. Sown the second week in February, it attains a good size by the beginning of July, fit for any exhibition; and that is not all: it is well adapted for heavy soil, as it does not split, a great point in a Carrot. Although of the Intermediate type, this variety does not grow to an ungainly size, but keeps in excellent symmetry throughout, a credit to it on heavy land. I have just taken up a splendidly uniform crop from this sort of land. *G. Ward, Brant-Broughton, Newark.*

NEW TEN-WEEK STOCK PRINCESS ALICE.—This white Stock is of great service just now in 48's and 60 sized pots for decorative purposes; it is very sweet and floriferous, and seems to do well in pots. The seed was sown in August, and another batch the first week in September, so we hope to have a supply till the Lathians come in. This variety, Princess Alice, was sent out by Messrs. Veitch & Son last spring, and where sweet-scented flowers are prized, it well deserves a place amongst such, being of easy culture, and requiring so little heat. Of course, sufficient heat should be applied to keep away damp. *W. A. Cook.*

ESTATE FRUIT NURSERIES.—I regret to find that my good friend, Mr. Crump, should have assumed that when commenting upon the general aspects of the paper which he read at Manchester, I should for one moment have deprecated what he was doing in relation to fruit-tree raising at Madresfield. I am quite open to correction, but I think Madresfield estate stands almost unique in its fruit nursery and distributive capacities. There may be others on which this sort of work is as ably and intelligently conducted, but, after all, on how few is it done at all, good or bad! It is not every gardener who would care to burden himself with the cares of an estate nursery, or finds the same enlightened encouragement from employers, that Mr. Crump enjoys. Had such action been general, we should have found one of the most difficult problems of the fruit-growing question solved long since. Under existing conditions, the free distribution of trees to all classes of tenants by landowners, as is done at Madresfield, is practically the only way to get over the lack of the tenure difficulty. As to the acceptance of Mr. Crump's invitation to go at once and see what he is doing at Madresfield, I should be delighted to do so, but, unhappily, circumstances prevent this. Still, it is certain, that what is there being done should, just now, be of the deepest interest, and for that reason it merits all publicity as well as generous criticism. *A. D.*

JERUSALEM ARTICHOKE.—Pray excuse my troubling your columns further on this subject, in answer to Canon Ellacombe, on p. 567. Filippo Re, Chevalier of the Order of the Iron Crown, Professor of Agriculture in the University of Bologna, &c., Italy, from whom I quoted, p. 482, is surely sufficient authority for anyone believing that *Helianthus tuberosus* is called *Girasole* in Italy. With reference to other matters, I think I have explained in my reply to Mr. Dod, all, excepting the Star of Bethlehem, which also will be found explained by Pryor, p. 223. Is it only the "vulgar error" of drawing deductions from mistaken hypotheses, or can Canon Ellacombe give authority for calling a Turkey a Turk? There is a vast difference between the two names, and I have never previously seen or heard it so designated, but will look it up. The name Turkey may probably (like the "Girasole" with the Jerusalem Artichoke) have come over with the bird, which deduction we may venture to consider favourable, from the fact that in the West Indies two plants, called there respectively Turkey berry and Turkey flower, are so called because poultry freely eat and fatten upon them. One word respecting the plant that Canon Ellacombe calls the "Girasole" of Italy. Is this the Jerusalem Gourd? The Ricinus or Palme Christi is the Kikaion of Hebrew Scripture, of which Jonah made his booth, to keep him from the sun, and which translators have called "Gourd," for what reason perhaps Canon Ellacombe, a biblical student and scholar, will kindly explain. In conclusion, Turkey is evidently of other derivation than Turk, and for which I intend to search all American authors I meet with, in order to solve; in the mean-

time, I submit it as an argument in my favour. Then we have Dandelion from Dent de Lion, Potatoes from Batatas, why not Jerusalem Artichokes from "Girasolo Artischoki"? *Wm. Etherington Dixon, P.S.*—Since writing the above, I have referred to a number of ancient works on South America, and have noticed the singular analogy the Turkie has with the Jerusalem Artichoke, especially in Spanish literature, in the fact of its peculiar anomaly of being mixed up with other birds, as the latter is with plants and places; also its early introduction into this country from Brazil, bringing its name with it, and having no more relations to Turkey and Turks than the other has to Artichokes or Jerusalem. *W. E. D.*

— May I ask a little room to reply to what Mr. Dixon says on p. 588? This note shall close the discussion, so far as I am concerned. Mr. Dixon says (1) that I do not tell him who the botanists are who have discovered that the Jerusalem Artichoke is not a native of Brazil; or (2) what its native country is; (3) he asks whether *Helianthus annuus*, a native of Peru, has a fruticose habit; (4) he says that it would be a serious libel on Asa Gray to say that he made either *H. doronicoides* or *H. giganteus*—non-tuberous plants—synonymous with *H. tuberosus*; (5) he charges me with inaccuracy in referring to De Candolle's *Prodromus*, p. 590, vol. v., for a description of Peruvian fruticose Sunflowers—the fact being that I took the reference from *Genera Plantarum*, but on verifying it, I find that the description of fruticose Sunflowers in De Candolle begins at the bottom of p. 590, and Peru is mentioned as a habitat on the top of p. 591, so I will try to be more precise in my references now. (1) Amongst botanists who know no Brazilian Sunflowers are Bentham and Hooker (see *Genera Plantarum*, vol. ii., p. 376). They say (I translate the Latin literally), under *Helianthus*, "species about fifty, mostly North American, very few Peruvian or Chilian." The few Peruvian differ in having a fruticose stem? Asa Gray (*Flora of North America*, vol. i., part 2, p. 280), gives the habitat of *H. tuberosus* as "moist alluvial ground, Upper Canada to Saskatchewan, and south to Arkansas and middle parts of Georgia," this answers (2). Next, in Nicholson's *Dictionary of Gardening*, under *H. tuberosus*, I find as the habitat "Upper Canada and the United States; it is certainly not South America, as stated in so many books." Replying to (3), *H. annuus* is neither fruticose nor Peruvian. See Asa Gray's *Flora of North America*, vol. i., part 2, p. 272, where the author says of *H. annuus*:—"It came not from Peru, nor even from Mexico." To conclude with (4): In Asa Gray's *Manual of the Botany of the Northern United States*, fifth edition, 1876, p. 258, I find under *H. doronicoides*:—"This is probably the original of *H. tuberosus*." Again, in *Flora of North America*, vol. i., part 2, p. 276, published 1884, the author says, under *H. giganteus*:—"It is the *H. tuberosus* of Parry, and *H. subtuberosus* of Bourgeau, the so-called edible tubers being tuber-like thickened root-stocks." In this work, however, Asa Gray makes *H. tuberosus* a distinct species. *C. Wolley Dod.*

ONIONS.—On p. 558 of the *Gardeners' Chronicle*, "J. S." gives some practical advice under this heading. When I, however, read it, one important point I thought was omitted, viz., the highly essential value of sowing only the finest stocks. Proof of this was confirmed when I read on a subsequent page of the same issue an account of an action brought by a farmer for loss sustained through a worthless crop. Could cultivators generally but see the great advancement made in the selection of Onion stocks by our Onion specialists, we should hear less of crop failures. Practical Onion growers do not give £6 10s. for eleven Onion bulbs (see *Gardeners' Chronicle*, January 31, 1891) to secure an ordinary strain only. The stocks that have produced such remarkable results when exhibited or grown by such Onion specialists as Messrs. Deverill, Kneller, Wilkins, Wingrove, Finlay, and other noted Onion pedigree producers, must not be confounded with the stocks usually kept in the seedsman's drawers. My contention is that for this result the cultivator himself is principally to blame. When he sees, for example, brown Globe Onion at 8d. per ounce, and in another list offered at 4d., he is apt to jump at the conclusion that his seedsman is pocketing the extra 4d., whereas, it may be found, that with the exception of the names being the same, the resemblance there ends. To cultivators I would give this advice, do not run your seedsman down because you find his price

higher than you see offered elsewhere. If dubious, try the two, and if you do find that his stock is no better than the cheaper list, then go at once to headquarters, i.e., to those who make Onion-growing a special feature, and you will then no longer complain of "miserable crops." To the trade generally I beg to tender this advice (knowing as the writer does a "little" of the trade), if you are anxious to secure for your customers high-class Onion stocks, you must depart from the usual routine, and search out your Onion specialists yourselves; to do this means money, but you may depend upon affording your customers a pleasant surprise compared with what they have been accustomed to in the shape of Onion crops. *Pioneer.*

TOMATOS AND CUCUMBERS FOR MARKET.—In last week's issue of the *Gardeners' Chronicle*, p. 614, there is an article on "Winter Tomatos," which says that the Old Red is the best variety. I thought so too, as I had grown them before, and always found them very good; but this year having grown them, and the fruit being of good size, averaging $\frac{1}{2}$ lb. each, and of good colour, on sending them to market, I cannot sell them. Then, again, with Rollisson's Telegraph Cucumber, which I have always considered of first quality, I find there is no demand for it, and yet the fruits are of good size, firm, and tender. Can any of your correspondents kindly tell me which Tomato and Cucumber are the best for market purposes? *N. H. C.*

CLIMBING NIPHETOS ROSE.—If the German correspondent you refer to on p. 586, would oblige us with his name and address, we should be happy to furnish him with proof of the climbing habit of this Rose. We can only conclude your correspondent has got the old variety. With reference to the paragraph of Mr. Cook on p. 619, we are well aware that there are some very large plants of the old variety in existence. We think though, that they are only comparative climbers, and we have never heard that they maintain the habit under propagation. Mr. Piper's opinion seems to be the almost universal one. The first season here it grew 22 feet between February and June; it is also a fact, that one shoot grew 15 inches in eight days, or $1\frac{1}{2}$ inches a day. The best blooms we have ever cut were from the climbing variety, and they were awarded 1st prize for the best twelve Roses in the Bath Rose show two years ago. *Keynes, Williams, & Co.*

— Seeing some suspicions thrown on the above Rose by your German correspondent, and also by Mr. W. A. Cook, on pp. 586 and 619, I can assure them both that the true climbing Niphetos is to be seen here in my nursery. I have twelve plants of the old Niphetos in the same house as the climbing one, and the difference in the foliage and habit can be easily seen when they are placed close together. My plant has made ten shoots, 8 feet long, since April, but there are no signs of the old variety running into long shoots, but plenty of flowers. *Amos Groombridge, Plymouth.*

BOCCONIA CORDATA.—Mr. Earley, in your last issue, does good service to your readers in calling attention to this graceful, silvery-foliaged, hardy plant. Mr. Rashleigh has naturalised it at Menabilly on a sloping bank, where its changeable foliage has a very pretty effect. It seems to succeed very well even under the shade of other trees. In other gardens in Corwall I also saw it naturalised in the same way, and it ought to do also in counties not so well favoured in climate. It were to be wished that this naturalising of plants which might prove perfectly hardy is not more frequently tried. In a dell at the Priory, Warwick, *Primula japonica* used to grow and spread quite freely. *Va. abond.* [No frost ever experienced in these islands will kill the plant if the soil be not waterlogged. Ed.]

THE ROYAL BOTANIC SOCIETY'S PRIZES.—"Prize Winner" writing under the above heading in last week's *Gardeners' Chronicle*, has opened up a subject which, perhaps, many who exhibit at the Botanic Society's shows, will be pleased to see ventilated. When I first exhibited at the Botanic, about four years ago, I, like your correspondent, wrote to the Secretary, and finding that availed me nothing, waited till showing time came round again the following year, and I then applied at the office, and was paid at once. It does seem a pity, that a Society like the Botanic should allow such a long time to elapse before paying the money awards to those who have won them. I know of no other Society that does so. *Exhibitor.*

FRUIT TREES FOR TENANTS.—My friend Mr. Crump has done good service in bringing this subject before the public, seeing that trees planted by the farmer or cottager are at once the landowner's property. It, therefore, is quite clear that the trees should be provided by him, the tenant undertaking to see that they are protected against stock and vermin. No one is so fit to select the kinds suitable for the district as the gardener, as from his experience he is most likely to know what will do well in that district. For example, many of the kinds which do splendidly in the valley of the Thames will not grow freely when planted at high altitudes. Another great mistake is the planting of too many kinds; if a farmer have a dozen reliable sorts it will be ample. The site should also be chosen by the gardener. The question now comes, what is the most desirable form of tree? I would say half-standards, and I am led to say this from what I see in this district. An orchard near the house is a pet place for the farmer for turning out his calves or other young things. Half-standards are not so exposed to high winds as standards, but in all cases suitable shelter must be planted around the orchard, and nothing answers so well for this as the Scots and Austrian Pines, the latter forming the outside row, as being the dwarfier of the two. A few years ago, there was a great scarcity of Apples in this country, and, hearing of an orchard not far off with plenty, I said to my foreman, as I went off to purchase, "There is some substantial reason why this man is doubly blessed while so many are left out in the cold." Sure enough, there was. The orchard was surrounded by a belt of Scots Pine; and fine Northern Greenings, without spot or blemish, and Golden Nobs, which sold for half a guinea per bushel, were in plenty. It did not take me long to plant Pine trees around our orchard after that, and with the best results. It is very grievous to see a fine old orchard, which has borne heavy crops, fast going to decay, simply through starvation. A good dressing of manure in the autumn occasionally, or stock constantly fed in the orchard, will soon cause a different state of things; we very often see the saw at work reducing the branches, when it is nourishment at the roots which is required. I know an orchard near here where the drainings of the farmyard is regularly diverted into it, and the result is most beneficial, and Winter Queenings, called Duck's-bill in Sussex, are as large as Blenheim's, and excellent for dessert in February. A very heavy crop of fruit is sometimes borne on a tree on a farm on this estate. In one year it produced 60 bushels; it was known by the name of French Pippin, and one of my men gathered the produce. For the moment I leave the Apple, and mention our Pear; I allude to that chance seedling growing on the gardener's cottage at Pitmaston, and now known as the Pitmaston Duchess. It is really a very fine kind; and even here, at 400 feet altitude, does splendidly as a standard. *J. Rust, Eridge Castle, Sussex.*

SOCIETIES.

TWICKENHAM HORTICULTURAL.

NOVEMBER 17, 18.—Though held so late in the season for the London district, yet the show held in the Town Hall was an extremely good one—better in many respects than some others which had preceded it. In spite of the dampness of the season, Chrysanthemum blooms came out wonderfully well. The groups were specially good, half-a-dozen being arranged; and as here an edging of Fern is allowed to them, the effect is far more pleasing than is usually the case.

Mr. Mitchell, gr. to W. Cunard, Esq., Orleans House, repeated his successes at Kingston and Teddington, putting up a superbly-flowered lot of plants, faced with an exceptionally good lot of Maidenhair Fern; Mr. Parsons, gr. to T. Twining, Esq., was a close 2nd, having also a very fine group, that rather lacked freshness in the flowers.

Very good trained plants were shown, not for competition, for these have wisely been cut out of the schedule. Very beautiful indeed were the half-dozen of fine bush *Bouvardias* shown by Mr. Parsons, who also had the best six zonal *Pelargoniums* in 6-inch pots, wonderfully bloomed; better plants, for the size of the pots, have rarely been seen. *Cyclamen* and Chinese *Primroses* were capital and plentiful, as also were table plants of the usual character. In a competition for dressed baskets of plants, Mr. Parsons was again 1st; *Plumbago rosea*, and some

dwarf single *Chrysanthemums* were very effective in his basket.

(1) miscellaneous plants, Mr. H. E. Fordham had a charming group of natural-flowered *Chrysanthemums*, *Heaths*, and other flowering plants; and Mr. H. A. Tracey had a pretty but small group of *Orchids*. Both these exhibitors are enterprising local nurserymen.

Cut Flowers.—The chief class in these was one for twelve Japanese and twelve incurved, the first place being taken by Mr. Mease, gr. to A. Tate, Esq., Leatherhead, who had of the former, *Avalanche*, *Etoile de Lyon*, *Madame J. Laing*, and Mr. H. Cannell, excellent; and of the latter, *Lord Alcester* (the premier incurved flowers), *Robert Cannell*, *Miss Ilaggas*, *John Lambert*, *Princess of Wales*, and others; Mr. C. J. Waite, gr. to the Hon. W. Talbot, Esher, was a very close 2nd, his Japanese, including a grand bloom of *Stanstead White* (premier Japanese), *Madame Baco*, *Sunflower*, *E. Molyneux*, &c., were all good.

Mr. Mease had the best twelve incurved flowers, Mr. G. Woodgate, Warren House Gardens, Kingston Hill, coming 2nd. This exhibitor had the best six incurved, one variety, in good *Empress of India*; Mr. Mease being 2nd, with *Hero of Stoke Newington*.

In the class for twelve Japanese, Mr. Waite was a good 1st, with *Etoile de Lyon*, *Mons. Bernard*, *Condor*, *Gloriosum*, &c.; Mr. Mease being 2nd, having very good *Lilian H. Bird*, *Sarah Owen*, Mr. H. Cannell, &c.

The best six Japanese were *Etoile de Lyon*, from Mr. Mease; Mr. Coombs, gr. to W. Furze, Esq., being 2nd, with the same variety.

Messrs. Woodgate and Waite had the best dozen blooms of *Anemone*-flowered varieties, *Lady Margaret*, *Fabian de Médiana*, *Jeanne Marty*, *Madame Cabrol* being *hæ*.

Numerous baskets of cut blooms, glass stands, bouquets, &c., were admirably shown.

The best bunches of black Grapes came from Mr. Griffin, Coombe Bank, who has shown so well generally this autumn; and Mr. Rickwood had the 2nd best in small but otherwise capital *Gros Colmar*. Mr. Mitchell had the best whites in well-finished *Muscat of Alexandria*, Mr. Griffin being 2nd with the same variety. Mr. Mitchell was also 1st with four dishes of fruit, having both good black and white Grapes, Pears, and Melons; Mr. Sage, Hove House Gardens, was 2nd. This exhibitor had the best four dishes of Pears.

Apples were very fine generally, especially a grand sample of *Peasgood's Nonsuch*, from Mr. Waite. This competitor had the best collection of six kinds of vegetables—capital samples; Mr. Garrod, gr. to Miss Vaughan, being 2nd. Mr. Mitchell had the best six Tomatoes—very fine samples. Mr. W. Punpart showed fine *Celery*, blanched *Seakale*, and fruit; and Messrs. Howell, Peed & Sons, Will Taylor, &c., had good collections of bardy fruit.

SALISBURY.

NOVEMBER 17, 18.—The Wilts Horticultural Society held its annual show of *Chrysanthemums*, cut flowers, and fruits in the County Hall on the above-mentioned dates, and although numerically there was a falling off in the exhibits, the quality of those staged was up to—and in some instances better than the usual standard.

Groups were well shown and effectively arranged. Mr. Frank Pearce, Crane Street, Salisbury, won the Ten-guinea Challenge Cup for the second time in succession, with capital plants; Mr. A. Robey, gr. to Captain Greenwood, Harnham Cliff, Salisbury, was a good 2nd; and Alderman Lovibond, St. Anne Street, Salisbury, was 3rd.

Mr. Hoskins, Poultry Cross, Salisbury, was a capital 1st in the class confined to amateurs. Mr. Curry, gr. to Colonel Pepper, Milford Hill, Salisbury was 1st for the most effectively-arranged group of miscellaneous plants; Mr. Robey was 2nd.

Cut blooms made a fairly good show. The principal class for thirty-six blooms was well contested. Mr. Neville, gr. to F. W. Flight, Twyford, Winchester, was 1st; Mr. W. Robinson, gr. to Lord Chief Justice Lopes, Heywood, Westbury, was a good 2nd; and Mr. George Inglefield, gr. to Sir John Kelk, Bart., Tedworth, Marlborough, was a very close 3rd. In the class for eighteen blooms, confined to amateurs, Mr. Follen, gr. to J. D. Willis, Esq., Bapton Manor, Codford, near Warminster, was 1st of three exhibitors.

Mr. Neville was 1st for twelve incurved, and Mr. W. Robinson obtained a like award for a dozen

blooms of Japanese, being followed closely by Messrs. Inglefield and Neville. Mr. Robinson was also 1st in each of the classes for twelve reflexed and twelve *Anemones*; Mr. G. Tucker, gr. to Major W. P. Clarke, Bellfield, Trowbridge, being a good 2nd in each case.

The ladies classes were well represented by Miss Agnes Flight, Winchester; Miss Ethel Mary Waters, Stratford-sub-Castle, Salisbury; Miss C. A. Mathews, Highfield, Salisbury; Miss Lovibond, Salisbury; Miss B. Flight, Winchester; and Miss Hodge, Dean, all displaying good taste in their various arrangements.

Fruit was not largely shown, but it was of excellent quality. Mr. H. W. Ward, Longford Castle, Salisbury, was 1st for a collection of six kinds. The same exhibitor took 1st for both *Lady Downes* and *Trebbiano Grapes*; and Mr. Chalk, gr. to George Read, Esq., Westwood, Salisbury, was the only exhibitor in the classes for *Black Alicante* and *Muscat of Alexandria*, and he was justly awarded 1st prize in both classes for very fine produce.

Apples and Pears of extra fine quality were shown by Mr. Thomas Hall, gr. to S. Montague, Esq.; Mr. South, Stoneham House, Southampton; and Mr. Fred. Smith, gr. to the Bishop of Salisbury, The Palace, Salisbury, who took the prizes in the order in which their names appear. They were the only exhibitors of Apples and Pears; Mr. Hall's *Beurré Diel* Pears were of immense size, and of perfect form and colour.

LIVERPOOL.

NOVEMBER 17, 18.—A splendid show was that held in St. George's Hall, on the above dates, the competition being exceedingly keen, and the exhibits of uniform quality. Mr. Bridge, assisted by a large and efficient committee, had all the arrangements well in hand.

Cut blooms deserve the foremost position. For forty-eight, Mr. G. Burden, gr. to G. Cockburn, Esq., Lingdale Lodge, Claughton, Birkenhead, won premier honours with a very fine lot, especially in the incurved section; Mr. R. C. Townsend, gr. to J. R. Greatorex, Esq., Mytton Hall, Shrewsbury, was a very close 2nd.

A Challenge Vase was offered for twelve incurved, twelve Japanese distinct, and twelve reflexed, in not less than six varieties, which produced a splendid competition. Mr. A. R. Cox, gr. to W. H. Watts, Esq., Elm Hall, Wavertree, succeeded in winning somewhat easily; Mr. D. Forbes, gr. to A. Holt, Esq., Crofton, Aigburth, was placed 2nd.

The class for eighteen incurved, distinct, was a strong one, the exhibits being very close in point of merit. Mr. J. Haynes, gr. to Mrs. B. C. Nicholson, Oswald Croft, Wavertree, was 1st; and Mr. R. C. Townsend, 2nd.

The leading position for twelve incurves was occupied by Mr. J. Edwards, gr. to H. Tate, Esq.; Mr. R. C. Townsend 2nd.

The most successful in the Japanese section, eighteen varieties, was Mr. T. Healy, gr. to Colonel Wilson, Hill Side, Allerton, amongst fourteen competitors; Mr. J. Gould, gr. to R. N. Dale, Esq., Bromborough Hall, Cheshire, was 2nd.

Reflexed and *Anemone*-flowered varieties were represented by good quality, if by few exhibitors. Pompons were poor.

Groups of *Chrysanthemums* were only moderate. Mr. T. Winkworth, gr. to R. Brocklebank, Esq., Chilwell Hall, was 1st.

Stove and greenhouse plants were good. For six, Mr. Jellicoe, gr. to F. Gossage, Camp Hill, Woolton, was an easy 1st.

Orchids were a distinct feature. For three, Mr. C. Osborne, gr. to H. J. Robinson, Esq., Amystry Court, Woolton, was 1st, showing *Odontoglossum*, grand *Cypripedium Harrisianum*, and *Dendrobium Wardianum*; Mr. Cox 2nd. *Cypripediums* were well shown by Mr. Harrison, gr. to G. Bateson, Esq., Elmhurst, Aigburth, who took the premier award.

Fruit was good, and the competition keen. For six dishes, Mr. T. Elworthy, gr. to R. Gladstone, Esq., Court Hey, Roby, was 1st; Mr. J. Bennett, gr. to the Hon. C. H. Wynne, Corwen, North Wales, 2nd.

For two black and two white bunches of Grapes, Mr. Elworthy was again successful in taking premier honours; Mr. J. Bennett, 2nd.

For two bunches, any variety, not *Alicante*, Mr. Swis, gr. to T. Smith, Esq., M.P., Carleton, Princes Park, Liverpool, won with *Gros Guillaume* in excellent condition; Mr. Ferguson, gr. to Mrs. Paterson, Rock Ferry, 2nd.

In the class specially set apart for *Alicante*, ten competed, Mr. Elworthy scoring another victory with shapely bunches, and good in colour and berry alike; Mr. J. Hottingsworth, gr. to J. S. Campbell, Esq., Woodseat, Uttoxeter, 2nd. Mr. G. Middleton, gr. to L. Pilkinton, Esq., Roby, was distinctly ahead for two bunches of *Muscat of Alexandria*; Mr. Wilson, gr. to H. Cunningham, Esq., Gorse Cop, Gateacre, 2nd.

Apples were excellent. Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, Derby, won for eight dishes of culinary varieties with well-coloured fruit. The Rev. S. Garnet Christleton, Chester, occupied a similar position for six dessert varieties.

HULL.

NOVEMBER 18, 19.—This exhibition has always been regarded as one of the best in the north; and the Artillery Barracks affords abundant space for both exhibits and the public alike. Messrs. Harland and Dixon, with Mr. R. F. Jameson, as chairman, deserve a word of praise for the efficient manner in which all the arrangements are carried out.

Much encouragement is annually given here for groups of *Chrysanthemums*, and foliage plants arranged for effect. It would be difficult to imagine better groups than the five competing ones on this occasion; all were meritorious, the 1st prize going to J. Ricketts, Esq. (gr., G. Wilson), Swanland Manor; Mr. J. Cottam, jun., Cottingham, 2nd.

Specimen plants were a decided improvement on other years. For three dwarf-trained, Mr. J. S. Graham, gr. to G. Lawson, Esq., Newland Grove, Hull, was ahead with good plants; Mr. J. Hemming, gr. to E. Leetham, Esq., Beech Hulme, Newlands, Hull, 2nd. Standards made a capital display, the previous winners again occupying similar positions. Pyramids were staged by Mr. Graham, in fairly good condition. Bush plants were well done by Mr. S. Smith, Norwood Nursery, Beverley, who received 1st prize.

Single varieties were a feature, so well were they flowered. Mr. A. Thomson, gr. to A. Clark, Esq., Priory Villa, Heasle, was the 1st prize-taker.

Cut blooms were the principal feature of the show. For twenty-four incurved, in eighteen varieties, the 1st prize was £10, which was carried off by Mr. Shoesmith, gr. to M. Hodgson, Esq., Shirley Cottage, Croydon, with an even stand of high-class blooms; Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, Derby, was 2nd, staging a good lot of blooms. Similar prizes were offered for the same number of blooms, Japanese distinct. Mr. G. Wilson secured the leading prize, with an even stand of high-class blooms; Mr. Shoesmith 2nd.

Twelve Japanese, distinct, was a strong class. Mr. Thornton, gr. to C. E. Marfleet, Boothby Hall, Lincoln, was 1st; Mr. G. Wilson 2nd.

Japanese varieties, staged with 8 inches of stem and foliage, made an interesting display, Mr. G. Wilson leading, followed by Mr. E. Wright, gr. to D. Wilson, Esq., Park House, Cottingham, 2nd.

Prizes were offered for twelve blooms of white Japanese. Mr. Appleton, gr. to C. H. Johnson, Esq., The Hall, Thorgumbald, Hull, was distinctly ahead.

Reflexed varieties were a feature, the competition being exceedingly keen. Mr. G. Appleton was 1st; G. E. Smith, Esq., Floral Cottage, Paull, 2nd. The last-named won for twelve *Anemone* blooms, with flowers possessing much merit; Mr. R. Walker, gr. to Colonel Stracey Clitheroe, Hotham Hall, Erough, was 2nd.

Sweet-scented *Chrysanthemums* receive encouragement here. For twelve, Mr. Harland, The Sycamores, Cottingham, was 1st.

Single varieties were fairly well staged by Mr. G. E. Smith, who took premier award; as he did also for twelve bunches of Pompons.

The premier bloom in the incurved section was *Lord Alcester*, in Mr. R. Falconer Jameson's stand; and one of W. W. Coles, belonging to Mr. G. Wilson, received a similar honour. The *Gardeners' Magazine* Silver Medal was awarded to Mr. Graham, for his three specimen *Chrysanthemum* plants, for the high cultural skill which they possessed; and the National *Chrysanthemum* Society's Certificate of Merit was awarded to the 1st and 2nd prize groups in the open competition.

Dinner-table decorations, bouquets, and other *Chrysanthemum* arrangements, were most interesting. For a table of wreaths, bouquets, &c., Messrs. Perkins & Sons, Coventry, took the lead in their usual way; Mr. C. Colebrook, Royal Nurseries, Grimaby, 2nd.

The prizes for the best decorated table, fully set,

brought a strong competition. The winner of the 1st prize, Miss Wheatley, showed considerable taste in arrangement, as also did Miss Ayre and Mrs. F. Jameson, for the prizes of 2nd and 3rd as here noted. David Wilson, Esq., contributed a handsome collection of Orchids, for which he received a Silver Medal.

YORK.

NOVEMBER 18, 19, 20.—The twelfth annual exhibition was held in the Fine Art Exhibition Building in this city on the dates named, and was in every way a success. A very pretty effect was made by arranging the groups of Chrysanthemums and foliage plants in circular form on the floor of the large room, and, as ample space was provided between each, a capital effect was produced. As usual, the arrangements were satisfactorily carried out by Mr. Lazenby, Secretary.

Cut blooms were staged in large numbers, and of fair quality. The principal class was for thirty-six, half to be incurved, and the remainder Japanese, £10 being offered as 1st prize, bringing seven competitors, the 1st prize going to Mr. P. Blair, gr. to the Duke of Sutherland, Trentham, with a fairly good lot; Mr. W. H. Hotham, gr. to Mr. Robinson King, North Ferriby, Hull, was a good 2nd. In the class for twenty-four distinct, eight competed: Mr. Blair again won; Mr. C. Lawton, gr. to Colonel Broadley, Welton House, Brough, 2nd.

Mr. Hotham won for twelve incurved in a strong class, as also he did for the same number of Japanese, staging well in both classes. Mr. Blair won 1st prize for six Japanese, any one variety, with good blooms of Avalanche; and also for six reflexed and twelve anemones.

Cut blooms of stove and greenhouse plants made a distinct feature, the best twelve coming from Mr. C. H. Letts, gr. to the Earl of Zetland, Aske Hall, Richmond; Mr. Blair, 2nd.

Plants as specimens and in groups were noteworthy. The best four incurved were remarkable for their freedom in training and flowering; Mr. Evered, gr. to Mrs. Crutch, Holgate Lodge, York, was 1st; as also was he for two specimens and for one. The best four plants in the Japanese section came from Mr. T. Smith, Beverley, large, freely-flowered, and devoid of formal training; he also took 1st prize for two plants.

The best groups of Chrysanthemums interspersed with foliage plants in circular form, were from Mr. Dawe, gr. to Dr. Baker, The Friend's Retreat, York; Mr. McIntosh, gr. to J. T. Hingston, Esq., Clifton, York, 2nd.

Ladies table decorations were on the whole effective, the most successful exhibitor being Miss Blanchet, 3, Muser Street, York.

Grapes, in three varieties, two bunches each, Mr. C. H. Letts won easily, with perfect examples of Alicante, Gros Guillaume, and Muscat of Alexandria; Mr. D. Dickinson, gr. to W. B. Richardson, Esq., Elm Bank, York, was 2nd. Mr. G. Lee, gr. to Sir J. Cowell, Bart., Clifton Castle, Bedale, won with Gros Colmar for black Grapes.

THE BOLTON CHRYSANTHEMUM SOCIETY'S EXHIBITION.

NOVEMBER 20, 21.—The Bolton Horticultural and Chrysanthemum Society (which is affiliated with the Royal Horticultural Society) held its fifth annual exhibition of Chrysanthemums, plants, fruits, and vegetables, at the Albert Hall. It is a gratifying circumstance that the efforts of the Society to promote the cultivation of flowers and fruit in this district have met with a very large measure of success, of which perhaps no better evidence could be afforded than the increasing interest which is being taken in the Society's yearly displays, and the accessions to be found in the list of exhibitors. This year, notwithstanding the fact that the season has been an unfavourable one for successful Chrysanthemum cultivation, the show was the largest the Society has held, and many of the specimens for competition were of the finest order.

The scope of the Society's work is far from being limited to a yearly display, which, to the general public, may mark the extent of its operations, and no little practical benefit is conferred during winter months by the lectures which are given under its auspices to those regularly employed in gardens, as well as to cottagers and gardeners. Financially, the

Society is in a satisfactory position, having a balance, though small, to reserve fund. Many of the latest novelties in Chrysanthemums were represented, including L. Behmer, Vivian Morel, Casar Costa, and R. Cannell.

The non-competitive exhibitors were numerous, and much more space will, in future, have to be devoted to them. Among those who came under this category were Messrs. Allen Bros., Henton, who had some fine examples of floral emblems on their bench; Messrs. William Clibran & Son, of Altrincham, who had a superb collection of rare Chrysanthemums; Mr. William Southern, of the Market Hall, Bolton, who had a large array of exotics; and Mr. W. Taylor, who had a choice assortment of a similar character. The following were the principal awards made:—

Open Classes.—Groups of Miscellaneous plants, arranged for effect.—1st, Mr. Thomas Wilkinson, (gr., Mr. John Pountain).

Group of Chrysanthemum plants, arranged for effect.—1st, Mrs. Charles Taylor (gr., Mr. J. Taylor).

Cut Blooms of Chrysanthemums, twenty-four large varieties, twelve incurved and twelve Japanese.—1st, and the Medal of the Royal Horticultural Society, Mr. John Stanning (gr., Mr. J. Kirkman).

Twelve Incurved.—1st, Mrs. Edward Cross (gr., Mr. J. Wainwright).

Twelve Japanese.—1st, Mr. John Stanning.
Open to all, except nurserymen, within eight miles of the Town Hall.—Six pots of Primulas.—1st, Mr. Thwaites (gr., Mr. G. H. Cross).

Six dinner-table plants.—1st, Mr. T. H. Thwaites.

For Chrysanthemum plants, six incurved, six Japanese, three incurved, and three Japanese, Colonel Ormerod was placed 1st in each of the four competitions.

Cut Chrysanthemum blooms (eighteen, nine incurved and nine Japanese).—1st, and the Medal of the Royal Horticultural Society, 1st, Mrs. E. Cross; 2nd, A. Knowles.

Twelve incurved.—1st, Mrs. Shaw.

Twelve Japanese.—1st, Mrs. E. Cross.

STOCKPORT CHRYSANTHEMUM SHOW.

NOVEMBER 20, 21.—A very fine show of Chrysanthemums, &c., was held in the Merchant's Institute on the above dates, which, as regards number of exhibits, has not been excelled in Stockport. The cut blooms were exceedingly good, but the pot plants, in some instances, were notable for the want of proper finish and trimness.

The miscellaneous plants were, on the whole, an attractive lot, and the exhibits of Messrs. Clibran & Sons, Altrincham, were greatly admired by the visitors, as also were those of Mr. Walker, the gardener at Vernon Park.

The opening ceremony was performed by the ex-Mayoress of Stockport, Mrs. W. Lee. The following were the principal prizes and prize-winners in the Chrysanthemum classes:—

Open division.—A group of Chrysanthemum plants, any varieties, arranged for effect in half-circle, 10 feet by 8 feet.—1st, J. F. Whitehead, Esq. (gr., T. Derbyshire); 2nd, J. C. Chorlton, Esq., Didsbury (gr., J. Horrocks). Six large flowering plants, distinct.—1st, J. C. Chorlton, Esq.; 2nd, J. A. Beith, Esq. (gr., F. Hart). Three large flowering plants, any variety.—1st, J. C. Chorlton, Esq. Single-flowering plant, Japanese.—1st, J. C. Jones, Esq. Single large-flowering plant, incurved.—1st, J. C. Chorlton, Esq.; 2nd, J. C. Jones, Esq. Three Pompons, distinct.—1st, J. Brown, Esq.

Miscellaneous Plants.—Groups of miscellaneous plants arranged for effect.—1st, Mr. C. Gleave, nurseryman, Stockport. Six dinner-table plants in pots.—1st, H. Rowland, Esq., Manchester (gr., Mr. J. Barclay); 2nd, C. J. Schofield, Esq., Whalley Range (gr., Mr. J. Wilson).

Cut Blooms of Chrysanthemums.—Eighteen cut blooms, large varieties, incurved and Japanese.—1st, Corporation of Stockport; 2nd, T. H. Sykes, Esq. Twelve cut blooms, incurved.—1st, T. H. Sykes, Esq.; 2nd, F. Whitehead, Esq. Twelve cut blooms, Japanese.—1st, T. H. Sykes, Esq.; 2nd, A. Galbraith, Esq.; 3rd, H. Marsland, Esq., Stockport (gr., Mr. J. Mathew). Twelve cut blooms, incurved and Japanese.—1st, J. Leigh, Esq., Brinnington (gr., Mr. J. Hadfield). Eighteen miscellaneous cut blooms.—1st, Corporation of Stockport.

Miscellaneous.—Six single spikes or trusses, Chry-

anthemums excluded.—1st, E. G. Wrigley, Esq. Spray of miscellaneous blooms.—1st, H. Marsland, Esq.

MANCHESTER CHRYSANTHEMUM SHOW.

NOVEMBER 24.—The annual show of Chrysanthemums was held in the Town Hall. Although the number of competitors of both plants and cut flowers was limited, there were some excellent contributions. At all shows of this kind, cut blooms take the lead, and here the quality was undoubtedly much better than we have seen at any former show of the Society. The stands of Mr. Goodacre, gr. to Lord Harrington; Mr. Blair, gr. to the Duke of Sutherland; and Mr. Horn, gr. to H. E. Robinson, Esq., Woolton, comprised the best grown and shown blooms, among which we noted the pink Etoile de Lyon, the golden-bronze Mrs. Wheeler, the golden wire-looking Gloriosum, Louis Behmer, fine pale pink; the grand effective golden Beauty of Castlewood, and W. H. Lincoln as being the best among the Japanese division.

In the incurved section there was nothing finer than the white Empress of India, although the old Queen of England as exhibited was quite magnificent, shaded blush; Lord Alcester, Princess of Teck, an excellent blush; Jardin des Plantes, Violet Tomlin, Lady Dorothy, a fine bronze; and Princess of Wales. Some excellent blooms were in the winning stand of J. K. Greatorex, of Shrewsbury, in both Japanese and in the incurved section; Mr. Goodacre was an easy 1st with his incurved blooms, which were large, and excellently exhibited. Among others, we might name Mr. G. Tomkinson, Tarpoley, Mr. T. H. Sykes, Cheadle, who was 1st in the twenty-four Japanese, and Mr. Blair, who had excellent stands generally, taking 1st position in the twelves, and who was 1st in the thirty-six miscellaneous cut blooms, followed by Mr. Tomkinson and Mr. J. C. Chorlton.

Among the most successful in plant-growing were J. C. Chorlton, Esq., Didsbury, and Mr. R. Hardwick, Ashton-on-Mersey, who took premier position in most of the classes. The plants were well grown, and clothed with leaves to the rim of the pot. The Pompons were a large exhibition, covering one side of the spacious hall, but they lacked the appearance of the larger sorts.

Wm. Clibran & Son, Altrincham, had a very effective table facing the orchestra, backed with Palms, and filled in with some of the best of Chrysanthemum blooms, mostly being finer than those of the dullish pink Etoile de Lyon; along with these was a fine stand of cut zonal Pelargoniums. Dickson, Brown & Tait had some very fine white and other Cyclamens; and Dickson & Robinson had Palms, Heaths, and Cyclamens; Pitcher & Manda had a contribution of cut Chrysanthemums.

Mr. Bruce Findlay sent some few plants from his garden, the most effective and novel among them was a collection of about fifty Cockscombs in flower. These had been late sown, and were well covered with foliage. There were also a few bright Cattleyas in flower, among which we recognised Cattleya labiata. Mr. Joseph Broome sent from Llandudno a charming exhibition of flowers, as clean and beautiful as if they had been grown under glass, among which were some late annuals, the Mignonne being extra fine, and the Roses Laurestinus, Gladioli, and Schizostylis looked well. The deep lavender-coloured Primula capitata is a grand border plant, and so is a white Antirrhinum named The Bride. There were a few excellent Dracenas, which went well as a centre row down the tables upon which the cut Chrysanthemums were staged. A very good piece of *Oncidium varicosum*, called Rogersi, was tabled from the collection of Mr. E. G. Wrigley. It had a large and much-branched panicle of more than ordinary symmetrical appearance.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 24.—A very interesting meeting of the Floral Committee of the above Society took place at the Royal Aquarium, Westminster, on the above date, a considerable number of fine varieties being staged for Certificates. M. Ernest Calvat, Grenoble, a French raiser, who has produced some remarkably fine varieties of Japanese Chrysanthemums, sent Madame Zurich, orange-cerise, with buff reverse, in the way of Sarah Owen; Madame Heuri Perrett, an ivory-white incurved Japanese, with primrose centre; and Madame Expulsion, a large incurved white Japanese, with delicate pink basal petals. Unfortu-

nately, the long distance these flowers had travelled robbed them of a great deal of their freshness.

From Mr. C. E. Shea, Foot's Cray, Kent, came some English Seedling Japanese, illustrating the remarkable advance being made in the direction of obtaining home-raised flowers. Mr. Shea had George Picker, Lionel Humphrey, a very fine and promising flower, which the committee wished to see again; it is in the way of Violet Rose, but darker in colour, both obtained from crosses made by Mr. Shea; also E. G. Hill, an American Japanese, two blooms of which were sent, one from a crown, the other from a terminal, to show the marked difference between flowers taken from the early and late buds; also blooms of Violet Rose, Japanese, Certificated last year.

From Mr. E. Beckett, Aldenham House, Elstree, came Japanese George Atkinson, a large white variety, like Avalanche, but later; Gaspard Rozain, a large pale incurved flower; Mrs. J. S. Fogg, deep yellow, of the shape of Avalanche, but thought to too closely resemble Edwin Beckett, a very fine variety from the same exhibitor, Certificated some time ago; Mrs. Levi P. Morton, a large pale-lilac Japanese with silvery reverse; and a highly promising seedling, unnamed.

Messrs. H. Cannell & Son, Swanley, sent Japanese incurved Mrs. F. A. Spaulding, bright nankeen-yellow, with long petals, very promising; E. G. Hill, in the way of Sarah Owen, salmon, with golden centre; Miss M. Wheeler, pearly-white; Gaspard Rozain, Emma Hilzeroth, a large full yellow Japanese; and the new and much-praised American incurved Ada Spaulding, a delicately-coloured, large, full flower, that should be grown from a terminal bud to have it well incurved.

Mr. Robert Owen, Floral Nursery, Maidenhead, sent a collection of fourteen new varieties, among them Countess of Hambleton, a magnificent variety of a soft, blush colour, the massive broad petals finely incurved, very distinct, and which was unanimously awarded a First-class Certificate of Merit; Lizzie Cartledge, also an incurved Japanese, lilac pink flushed with purple and silvery white reverse—First-class Certificate; J. P. Kendall, bright deep rose, silvery reverse, large incurved; Richard Nisbett, in the style of Sunset; Mrs. Bruce Findlay, a soft deep blush flower, in the way of Condor; F. W. Flight, ruby-cerise, reflexed, very bright in colour; Harry E. Widener, a large yellow Japanese; Madame Darquier, rosy pink with pale centre; Mrs. J. S. Fogg; Madame Camille Gironde, a large white broad-petaled flower, very pure in colour, incurved; Matthew Russell, a sport from Princess of Wales, like Mrs. S. Coleman, and thought to be not sufficiently distinct from it; Flora Macdonald, incurved, a large white variety of the Princess of Wales type; and Japanese incurved William Tunnington, in the way of La Japonnais, darker, very broad in the petals, and full of promise (Commended).

From Mr. J. Dibbens, nurseryman, Brockley, came a very fine English seedling Japanese named J. S. Dibbens, a large yellow flower, the basal florets slightly tinted with pale salmon; large, deep, and full (First-class Certificate).

Mr. R. Cawte, Esher, sent incurved Brookleigh Gem, a sport from Jeanne d'Arc, of a pretty silvery lilac-pink colour. From Mr. E. Cox, Brickendon, Herts, came Lizzie Cartledge, and Mrs. J. S. Fogg, described above. Mr. Herbert Sutton, Lower Redlands, Reading, sent a white sport from Sunflower, which the committee recommended should be grown another season and seen again.

From Mr. James Weston, Ravenholme, Balham, came Pompon Ethel Weston, a supposed sport from Rosinante, which it greatly resembles. Mr. W. Lane, King's Ride, Ascot, sent Japanese Lizzie Cartledge; from Mr. E. S. Wiles, The Gardens, Edgecote Park, Banbury, a sport from Guernsey Nugget, in the form it usually takes; and the same characteristic holds good of an incurved form of Cullingfordii sent by Mr. A. Wright, The Gardens, Devonhurst, Chiswick. Mr. N. Davis, nurseryman, Camberwell, sent Japanese Lilian S. Cole, a distinct white sport from Etoile de Lyon, which the Committee wished to see again.

Messrs. Pitcher & Manda, Hextable, Swanley, sent Japanese Primrose League, white, with slight primrose centre, and E. D. Adams, a large, deep, pale-coloured incurved Japanese, which becomes suffused with pink reticulations. Mr. Dismore, Harrow Weald, sent Kioto, a fine yellow Japanese, already Certificated; Leon Frache, and Thomas Cartledge, Japanese, reddish-brown, with yellowish-buff reverse.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending November 21, is furnished from the Meteorological Office:—

"The weather continued very rainy and unsettled in all parts of the Kingdom during the earlier part of the week, but towards its close a considerable improvement occurred, although rain still fell occasionally in the N. and N.W.

"The temperature was slightly below the mean in 'Ireland, S.' but about equal to it in 'Ireland, N.' but in all parts of England and Scotland it was above the normal value, the excess in 'England, S.' being as much as 4°. The highest of the maxima were registered either on the 18th or 19th, and ranged from 50° in 'Scotland, N.,' 53° in 'Scotland, W.,' and 55° in 'England, N.E. and Scotland, E.,' to 58° in 'Ireland, N.,' and 59° in 'England, N.W.' and the Channel Islands. The lowest of the minima, which were recorded on somewhat irregular dates, ranged from 26° to 31° in 'Scotland,' from 26° to 29° in 'Ireland,' and from 30° to 32° over 'England.' In the 'Channel Islands' the thermometer did not fall below 43°.

"The rainfall was a little more than the mean in 'Scotland, E.' and 'England, N.W.,' and just equalled it in 'England, N.E.,' the 'Midland Counties,' and 'Scotland, W.' In all other districts there was a deficit, and this amounted to half the average in 'England, S.W.,' and a still larger proportion in the 'Channel Islands.'

"The bright sunshine shows an increase in the 'Grazing,' and a decrease in most of the 'Wheat-producing' districts. It has, however, been less than the mean in nearly all districts. The percentage of the possible duration ranged from 33 in 'Ireland, N.,' and 24 in 'Scotland, W.' and 'Ireland, S.,' to only 7 in 'England, E. and S.'"

THE "TEMPLE SHOW."—We learn that by permission of the Treasurer and Benchers of the Inner Temple, the great summer show of the Royal Horticultural Society will be held in the Temple Gardens on June 1 and 2, 1892, that is immediately in advance of the series of shows proposed to be held at Manchester in that month.

LARGE PITMASTON DUCHESS PEARS.—Last month 1 gathered twenty-six Pears (the crop) from a tree of Pitmaston Duchess, which is planted against a S.E. wall, and is about sixteen years old. The six best fruits weighed 7 lb. 14 oz. Is this an extraordinary weight? [Yes, we have no record of such heavy fruit. Ed.] Last Whit-Sunday (May 17), the tree was in full bloom, and the blossoms were covered with snow for some time, same as most of the other Pears. The tree is a regular bearer. J. Borlase Tibbits, Barton Seagrave Hall, Kettering.

MARKETS.

COVENT GARDEN, November 26.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Business quiet. Prices unaltered. James Webber, Wholesale Apple Market.

POTATOS.

Arrivals during the week have been much heavier, and as the demand has not increased, the stocks on hand are nearly double. Trade dull. J. E. Thomas.

SEEDS.

LONDON, Nov. 25.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pool, London, S.E., report a firm market for American and all other descriptions of

Red Clover seed. White seed more particularly has this week been in favour, at advanced values. There is no change in either Alsike, Trefoil, or grasses. Blue boiling Peas hold their own; arrivals continue meagre, and stocks generally are remarkably light. Giant and small Haricot Beans tend upwards. New Scarlet Runners are now cheap. Canary seed show a further rise of 1s. per qr. Hempseed keeps firm. Winter Tares are in somewhat improved request. Buckwheat, Linseed, and Dari are steady.

FRUITS AND VEGETABLES.

SPITALFIELDS: Nov. 24.—Quotations:—Cabbages, 1s. 6d. to 2s. 6d. per tally; Savoys, 2s. to 2s. 6d. do.; Cauliflowers, 2s. 6d. to 10s. do.; Greens, 1s. to 1s. 6d. per dozen bunches; Turnips, 1s. 9d. to 2s. do.; Carrots, 1s. to 2s. 6d. do.; Onions, 2s. to 2s. 6d. do.; Parsley, 1s. 6d. to 2s. do.; Beetroot, 1s. to 2s. 6d. do.; Spinach, 1s. to 1s. 9d. per bushel; Brussels Sprouts, 9d. to 1s. 3d. per half-sieve; Parsnips, 4d. to 9d. per score; Cos Lettuce, 4d. to 10d. do.; Endive, 1s. to 1s. 3d. per dozen; Cabbage Lettuce, 3d. to 6d. do.; Leeks, 1s. 6d. to 2s. 6d. do.; frame Cucumbers, 1s. 3d. to 1s. 9d. do.; Belgian Onions, 3s. to 4s.; Dutch do., 3s. 3d. to 4s. 6d. per bag of 110 lb.; Spanish do., 6s. to 6s. 6d. per case; Celery, 6d. to 1s., and Horseradish, 1s. to 1s. 1d. per bundle; English Apples, 3s. to 6s. per bushel; American do., 10s. to 12s. per barrel; Pears, 1s. 6d. to 2s. 6d. per half-sieve; English Tomatos, 5s. to 7s. 6d. per peck; foreign do., 1s. to 1s. 9d. per per box.

BOROUGH: Nov. 24.—Quotations:—Cabbages, 2s. to 3s.; Savoys, 2s. 6d. to 3s.; Broccoli, 4s. to 5s. per tally; Spinach, 2s. to 3s. 6d. per bushel; Turnips, 1s. to 1s. 6d.; Carrots, 1s. to 1s. 9d. per dozen bunches; English Onions, 4s. 6d. to 5s. per cwt.; English Apples, 2s. to 6s., and Pears, 2s. 6d. to 7s. per bushel; Canadian Apples, 12s. to 25s., and Newtown Pippins, 18s. to 45s. per barrel.

STRAFORD: Nov. 24.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Cabbages, 2s. to 3s. per tally; Savoys, 3s. to 5s. do.; Greens, Collards, 1s. 9d. to 2s. 3d. per dozen; do., 1s. 3d. to 1s. 9d. per bunch; Cauliflowers, 9d. to 1s. 3d. per dozen; do., 3s. 6d. to 7s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 30s. to 42s. per ton; Carrots, household, 28s. to 40s. do.; do., cattle-feeding, 25s. to 32s. do.; Parsnips, 9d. to 1s. 6d. per score; Mangels, 14s. to 18s. per ton; Swedes, 21s. to 23s. do.; Onions, English, 100s. to 120s. do.; do., Dutch, 2s. 9d. to 4s. 6d. per bag; do., Oporto, 6s. 6d. to 8s. per case; Apples, American, 14s. to 21s. per barrel; Sprouts, 1s. to 1s. 3d. per half-sieve; do., 2s. to 2s. 6d. per sieve; Celery, 8d. to 1s. 6d. per roll; Horseradish, 10d. to 1s. 6d. per bundle.

POTATOS.

SPITALFIELDS: Nov. 24.—Quotations:—Magnums, 60s. to 75s.; Regents, 60s. to 70s.; Champions, 55s. to 65s.; Imperators, 55s. to 75s.; Hebrons, 60s. to 80s.; Snowdrops, 60s. to 70s. per ton.

BOROUGH: Nov. 24.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 55s.; Bruces and Magnums, 70s. to 90s. per ton.

STRAFORD: Nov. 25.—Quotations:—Magnums, 65s. to 85s.; Hebrons, 70s. to 85s.; Imperators, 65s. to 85s.; Regents, 65s. to 75s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Nov. 21, and for the corresponding period of last year:—1891, Wheat, 38s. 9d.; Barley, 31s. 3d.; Oats, 28s. 4d. 1890, Wheat, 32s. 9d.; Barley, 28s. 11d.; Oats, 17s. 8d. Difference: Wheat, +7s.; Barley, +2s. 1d.; Oats, +4s. 8d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; do., inferior, 40s. to 75s.; hay, best, 60s. to 92s.; do., inferior, 28s. to 59s.; and straw, 20s. to 40s. per load.

NOTICES TO CORRESPONDENTS.

Books: Constant Reader. *Watercress*, by Shirley Hibberd, published by Messrs. W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.—*Alexander Black.* *Henry's Elementary Course of Botany*, 4th edition (John Van Voorst, Paternoster Row, London, E.C.).

CHRYSANTHEMUM SPORT FROM LA TRIOMPHANTE: H. E. F. The bloom has good form, but the colour has nothing to recommend it.

FELLOW OF THE ROYAL HORTICULTURAL SOCIETY: F. W. R. You will be furnished with the information you seek by applying to the Secretary, Rev. W. Wilks, 117, Victoria Street, Westminster.

FELLOWSHIP OF LINNEAN SOCIETY: C. J. D. Communicate your wish to become a Fellow to the

Assistant-Secretary, Dr. J. Murie, M.D., LL.D., Offices, Burlington House, Piccadilly, London.

FOACING PIT: Hortus.—Your forcing-pit is sufficiently heated and ventilated for the growth of either Tomatos or Cucumbers; but as the former do not require so high a temperature, so much aerial or root moisture, or so little ventilation, as the latter, they would be better grown apart. Divide your pit into two parts, and arrange the hot-water pipes so that you can regulate the heat as may be desirable, that is, put in a T-shaped connection in the bottom-heat and top-heat pipes, close to the partition, and just beyond this put throttle valves in the flow pipes. We cannot advise you as to the more profitable subjects to grow. The markets are flooded with home and foreign produce, and prices seldom rule high.

FRUIT GROWERS FOR MARKET: A. B. We are unable to do as you wish. Why not make enquiries in the large markets in London and elsewhere?

GEMMED PEACH TREES: J. Bowie. Transplant the trees, drain the border if wet, keep the roots near the surface, disbud gradually, commencing not earlier than June 6, and keep the shoots thin by disbudding during growth, so that but little winter-pruning will be needed.

HEAVIEST BUNCH OF BLACK HAMBURGH GRAPES EVER SHOWN IN THE BRITISH ISLES: J. M. On August 21, 1874, Mr. Hunter showed at Belfast one bunch of Black Hamburg Grapes weighing 21 lb. 12 oz.

INSECT-EATING BIRDS: C. T. We shall shortly be publishing an account of insectivorous birds of this country. There is no kind of netting that would suit all sorts of birds.

MARGUERITE MAGGOTS: T. S. We know of no remedy beyond picking off the leaves and burning them.

NAMES OF FRUITS: T. H. 9, Colonel Vaughan (pale); 10, Domiuo; 11, Cox's Orange Pippin; 14, Bedfordshire Foundling; 17, King of the Pippins; 20, Lewis's Incomparable; 21, Dutch Mignonne; 23, Duke of Beaufort; 24, Winter Peach; 25, Old Nonpareil; 26, Court of Wick.—*C. E. W.* 1, not known—specimen much bruised; 2, Pear, Winter Nelis; Apple, Maltster.—*Lavant.* Apple: Peasgood's Nonsuch—*Forge.* 1, Catillac; 2, Maréchal de la Cour.—*J. E. N.* 1, Hawthornden (new); 2, Chaumontelle; 18, Rymer; 20, Nonsuch; 25, Comte de Lamy; 30, Lucombe's Pine; 212, Golden Harvey.—*Thos Taylor.* Your Pear is Doyenné du Comice.—*J. Methuen.* Apple: Cox's Pomona.—*Correspondent.* 1, Dutch Mignonne; 2, Chaumontelle.—*C. T.* Pears quite rotten; impossible to name.

NAMES OF PLANTS: G. B., Mont St. Amand. *Mormodes*, new species. Please send particulars of plant, and state its origin, to enable description to be finished. Can you spare a leaf?—*C. Woodbridge.* *Cypripedium insigne*, variety with unusually yellow lip and petals.

SHOWING REFLEXED CHRYSANTHEMUMS: C. H. As the schedule contained no class for Japanese reflexed varieties, the exhibitor was not within his right in showing them, the ordinary reflexed varieties being those for which the prizes were offered by the Society.

SKIN IRRITATION AND PRIMULAS: I. T. H. Some persons when handling plants of *Primula obconica* suffer from a kind of rash on the hands, arms, and sometimes the face.

VINERIES: J. Bowie. 1, There being less variation in the temperature in span houses, if large, the Grapes keep best in these; but, after all, the good keeping of Grapes hanging on the Vine depends greatly on the management of the vinery, and very little on size, aspect, or form. 2, If the house is of wood, you might have portable sashes over the greater part of the roof, the ventilating portion excepted. 3, The panes of glass might be 3 feet by 10 inches. 4, Fix training wires at 1½ feet from the glass.

Messrs. Hill & Smith.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glass-house, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

THOMAS GREEN & SON, LIMITED,

SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

The Best Boiler Extant.

FRONT ELEVATION

LONGITUDINAL SECTION

SECTIONAL PLAN.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIALS.

Messrs. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four-stories high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Yours faithfully, (Signed) G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

AUTUMN and WINTER PRUNING,

TRIMMING, and THINNING OUT can be better and quicker done by the STANDARD MANUFACTURING COMPANY'S celebrated TOOLS, including the "STANDARD" and "GIANT" TREE PRUNERS, the "MYCICUTAH," and other useful appliances, than by any means. They were shown in actual use at the recent Horticultural Exhibition, Crystal Palace, and at the great Agricultural Shows at Bath and Doncaster; thousands of visitors being astonished at their wonderful power and scientific efficiency, coupled with great saving of time and labour, and the risk to life and limb reduced. After Stormy Weather, these Tools will be found invaluable for cutting off fractured branches, leaving the ends severed in a vital condition.

Illustrated CATALOGUES can be had, post-free, from the PATENTEES and MAKERS, at their works and depot, ST. ALKMUUND'S CHURCHYARD, DERBY; or of the principal Ironmongers and Seedsmen, the leading stores, and kindred trades throughout the world.

CHRYSANTHEMUMS,

And How to Grow Them. By C. E. SHEA, Esq.

A Practical and Scientific Treatise, that will be of great service, both to the oldest and most successful exhibitor and the youngest grower of the Autumn Queen. Mr. Shea has, by the treatment explained in his treatise, had a long series of triumphs, to which this season he has added, in keena competition with our most noted growers, at the Kent Conaty, Watford, and Crystal Palace, finishing with the difficult feat of 1st in the 48 Japanese, at the Royal Aquarium Show, Nov. 10.

In addition to the above, a paper by Mr. H. Shoesmith is included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world.

This valuable work is now ready, post free, seven stamps.

H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham.

MONOGRAPHIE DER ABETINEEN DES

JAPANISCHEN REICHES. — A Geographical and Systematic Description of the JAPANESE FIRS, SPRUCES, LARCHES, HEMLOCKS, and PINES. With Seven Coloured Plates. Edited by DR. HEINRICH MAYR, Professor to the Imperial Japanese University of Tokio.

The Scientific Value and the Reliability of this New Work has been acknowledged in terms of praise by the Editor of this Paper.

The Illustrations, and the exact description of Young and Full-Grown Trees, written in plain and easy German, will enable Nurserymen and all who are interested in the Cultivation of Japanese Conifers: 1st, to identify their specimens; 2nd, to order the seeds of wished-for Japanese Conifers by their true native names; 3rd, to control the seeds sent from Japan.

Forty-three Varieties of Japanese Pines are described in the book. Those varieties, which comprise Forms of the very First Ornamental Value, can be ordered from Japan as pot-plants by their native names, given in the book.

Imperial 4to. Price 20s. Sent free, if money-order be paid directly to G. HIMMER, Librarian to the University, 2, Odeonsplatz, Munich, Germany.

Belgian.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be satisfied and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first-rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

GARDENER (HEAD); age 53.—J. E. MCLEAVE, eight years' Head Gardener to R. Heywood Jones, Esq., Beaswood Hall, Pontefract, is open to a re-engagement in good establishment. Nineteen years' experience in all branches. Testimonials of the highest order.—9, Montpelier Place, Brompton Road, London.

GARDENER (HEAD).—A Gentleman recommends an energetic, sober, industrious, reliable man. Skilled in Stove Plants, Orchids, Decorating, Forcing Choice Fruits, Flowers and Vegetables. Master of his work all round. Won over 100 prizes.—NUNN, 29, Oxford Terrace, West Norwood.

GARDENER (HEAD).—Age 30. Fourteen years' experience in all branches. Well recommended. MESSRS. BROWN, Wotthorpe, Stamford.

GARDENER (HEAD), where two or three are kept.—Age 29, single; thoroughly experienced in all branches. Excellent references and testimonials.—GARDENER, 5, Upper Pellipar Road, Woolwich.

GARDENER (HEAD).—THOMAS HARE, for seventeen years Head Gardener to R. H. C. Neville, Esq., Wellingore Hall, would be glad to hear from any Lady, Gentleman, or Gardener, particulars that may lead to appointment in a large establishment. Well qualified. Excellent testimonials. Letting of place, cause of leaving.—Wellingore, Lincoln.

GARDENER (HEAD), where the produce is grown for Market.—Eighteen years' practical experience.—W. BRYAN, The Vineyard, Potter's Bar.

GARDENER (HEAD), where two or three are kept.—Age 25, married, without family; ten years' experience inside and out. Abstainer. Good references.—G. M., 13, Clifton Terrace, Ashville Road, Leytonstone, Essex.

GARDENER (HEAD), or GARDENER and FORESTER; age 41.—GEORGE WILLIAMS, for the past fifteen years Head Gardener and Forester to the late and present Right Hon. Lord Curzon, at Castle Boro, begs to offer his services to any Lady or Gentleman requiring a thoroughly practical man.—9, Lennox Street, Dublin.

GARDENER (HEAD), or GARDENER and BAILIFF.—Age 40, married; one son, aged 15. Twenty-six years' practical experience in all branches, in good establishments. Wife could undertake Poultry. Excellent references.—A. A., 12, Victoria Terrace, Graham Road, South Wimbledon.

GARDENER (HEAD WORKING), where two or more are kept.—Married, no incumbence. Life experience in all branches. Ten years' character from last situation.—T. H., 54, Bramford Road, Wandsworth.

GARDENER (HEAD WORKING), where three or four are kept; age 36, married.—A LADY (widow), making changes, desires to recommend a steady, industrious man, who has lived ten years in her employ, with four under him. Abstainer. Trained at Chatsworth, under the late Mr. Speed.—Mrs. MARKHAM, Tapton House, Chesterfield.

GARDENER (HEAD WORKING).—Age 40 (two boys, 8 and 6); thoroughly practical in all branches. Land and Stock, if required. Good character and reference.—W. T., 23, Queen Street, Mayfair, W.

GARDENER (WORKING).—Age 38. To grow for Market—Grapes, Peaches, Cucumbers, Melons, Tomatoes, Mushrooms, Cut Flowers, &c.; or would take charge of a good Jobbing Connection. Good references.—GARDENER, 5, Selwood Cottages, East Barnet, N.

GARDENER (SINGLE-HANDED), or otherwise.—Age 32, single; eight years in Market Vegetable and Fruit Garden, small Stove and Greenhouse.—A. MOORE, Ruscombe, near Reading, Berks.

GARDENER (SINGLE-HANDED, or SECOND).—Age 24. Experienced in Roses, Cucumbers, Melons, Tomatoes, &c.; also Flower and Kitchen Gardens. Good references.—A. BEALE, 58, Garland's Road, Red Hill, Surrey.

GARDENER.—Advertiser (age 40, married; one boy, 12 years) is open to engage with any Lady or Gentleman requiring the services of a good all-round, practical Gardener. Excellent testimonials for fourteen years as Head Gardener.—W. S., 306, High Street, Aston, W.

GARDENER, where one or two are kept, or good SINGLE-HANDED.—Age 29; good reference.—GARDENER, Mrs. Cheney, Upway, Dorchester.

GARDENER.—Age 35, married, two children. HY. GARRETT, Gardener to G. Gwynne Holford, Esq., would be glad to recommend his Foreman, Hy. Powell, as above. He has served under him fourteen years, having had twenty years' experience in practical gardening in all its branches.—Buckland Gardens, Bishel, R.S.O., Breconshire.

GARDENER, with help.—Age 30, single at present; well up in all branches. State wages, &c. Excellent testimonials and references.—ASHWELL, Bedford Road, Morchager, Sandy, Bedfordshire.

GARDENER (UNDER).—A Lady wishes to recommend a young man of 19 as above; nearly two years in last situation. Good character.—A. DEADMAN, Arnold's Cottage, Hayward's Heath, Sussex.

GARDENER and COWMAN.—Well up to his work. Three years' good character.—J. L., 3, Watney's Cottage, Jew's Row, Wandsworth, S.W.

PROPAGATOR and GROWER, or FLORIST.—Age 25; nine years' Nursery experience. Palms, Ferns, Stove, and Soft-wooded Propagation, Forcing, &c. Wreaths, Bouquets, Decorations.—A., 62, Victoria Road, Burton-on-Trent.

EDWARD BENNETT, F.R.H.S., Harefield Gardens, Uxbridge, having let his Vineyard Nursery, Potter's Bar, can with every confidence recommend to Market Growers his late GROWER and MANAGER.

To Fruit Growers, &c., for Market.

MANAGER, or GENERAL FOREMAN.—Thoroughly experienced in Grapes, Tomatoes, Cucumbers, Palms, Ferns, Cut Flowers, &c., in quantity. Twenty years' experience. Highest references.—ALPHA, 1, Grove Road, Mitcham.

FOREMAN, Inside or General.—Age 25; good Plant and Fruit Grower. House and Table Decoration. Ten years' experience. Excellent character.—S. YOUNG, Ranston Gardens, Blandford.

To Nurserymen.

FOREMAN, or GROWER.—Age 38, married; thoroughly experienced in Grapes, Cucumbers, Tomatoes, Mushrooms, and Cut Flowers. Good references.—C. W., Grange Hill, Chigwell, Essex.

FOREMAN, under Glass, or Kitchen Garden and Pleasure Grounds; married, age 39.—Advertiser seeks situation as above. Fifteen years' experience in large places. First-class character and references.—T. Mr. William Tuggell, Matching, Harlow, Essex.

FOREMAN, in good Nursery.—Well up in Orchids, Palms, Ferns, Chrysanthemums, Carnations, Bouvardias, and Early and Late Forcing. Twelve years' experience.—A., Fern Cottage, Harpenden, Herts.

FOREMAN and SALESMAN, or PROPAGATOR and GROWER.—Sixteen years' experience in growing large quantities of Plants and Cut Flowers for Market, such as Cyclamens, Double Primulas, Pelargoniums, Chrysanthemums, Roses, Palms, Ferns, and different plants usually found in a Nursery. Well up in Wreaths, Crosses, and Bouquets.—ALPHA, 7, Clarence Cottages, Hextable, Kent.

JOURNEYMAN (SECOND), Inside.—Age 20; six years' experience Inside and Out. Good reference.—A. BARKER, Freston Hill Lodge, Ipswich, Suffolk.

IMPROVER to a Gardener.—F. THORNTON, Gardener to C. E. Marlett, Esq., Boothby Hall, Lincoln, can recommend a strong Youth, age 17, as above. Four years in the above Gardens.

TO GARDENERS, &c.—A young Englishman, just returned from Germany, seeks situation in Garden, Shop, or Office; experience in each.—G. G., 45, Langborough, Wokingham, Berks.

TO GENTLEMEN'S GARDENERS.—Young man requires situation as SECOND, or THIRD, under Glass.—Age 23; abstainer. Good references.—T. J., 101, Moffat Road, Thornton Heath.

TO GARDENERS.—A young Man (age 21) seeks re-engagement under a Foreman in a good establishment. Two years in present situation, five in last. Good references.—H. M., The Gardens, Elm Grove, Kingclere, Hants.

TO GARDENERS.—A young man, age 20, seeks engagement as Second or Third in a Private Garden or Nursery. Five years' character. Bothy preferred.—F. BUCH, 15, Ship Street, Folkestone.

TO NURSERYMEN, SEEDSMEN, and FLORISTS.—A young man wants situation as ASSISTANT (Shop, Warehouse, or Nursery). Has had good experience.—WHITE, 60, Bellevue Crescent, Clifton, Bristol.

TO NURSERYMEN.—Situation wanted in a Market Nursery. Used to Ferns, Roses, Carnations, Palms, and the general routine of the Trade.—L. H., 2, St. Mark's Street, Kemp Town, Brighton.

Seed Trade.

TRAVELLER, BOOK-KEEPER, or MANAGER.—Age 31; thoroughly experienced. Good appearance. First-class references. Writes shorthand. Eleven years with Hurst; four years with Hunter, Chester.—W. 81, C. Birchall, Advertisement Contractor, Liverpool.

TO GROWERS of FRUIT UNDER GLASS.—Two young men (age 25 and 23), with ten and eight years' experience in Foreign and English Nurseries, well up in the Cultivation of Fruit Trees, offer their services as above.—Good references.—H. Y., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (ASSISTANT).—Nine years' experience in Seeds, Bulbs, Plants, &c. Good references.—J. H., The Birches, Wordley, Stourbridge.

SHOPMAN, or MANAGER.—Age 32; thorough knowledge of Seed, Bulb, Plant, and Flower Trade. Good references. State particulars.—W. HARRIS, Hammerwood, East Grinstead, Sussex.

Seed Trade.

SHOPMAN (ASSISTANT).—Age 21; six years' experience in Seeds, Bulbs, Plants, Cut Flowers, and Fruit. First-class references from present employer.—W. H. T., Mr. Wm. Barrack, Florist, Kendal.

SHOPMAN (ASSISTANT), age 21.—THOS. SKENEDY & Co., Seed-men, Dumfries, N.B., can highly recommend a young man as above. Able to assist in Book-keeping, and writes Shorthand.

HOLLOWAY'S PILLS.—Nervousness and want of Energy.—When first the nerves feel unstrung, and listlessness supplants energy, the time has come to take some such alterative as Holloway's Pills to restrain a disorder from developing itself into a disease. These excellent Pills correct all irregularities and weaknesses. They act so kindly, yet so energetically, on the functions of digestion and assimilation, that the whole body is revived, the blood rendered purer, while the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated. These Pills are suitable for all classes and all ages. They have a most marvellous effect on persons who are out of condition; they soon rectify whatever is in fault, restore strength to the body, and confidence to the mind.

LOOK TO YOUR BOILERS, And replace INEFFICIENT and DEFECTIVE ONES by WEEKS'S PATENT DUPLEX UPRIGHT TUBULAR,

MESSRS. LINDEN,

L'HORTICULTURE INTERNATIONALE, BRUSSELS, HAVE INSTRUCTED

MESSRS. PROTHEROE AND MORRIS to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheap-side, London, E.C., on FRIDAY NEXT, December 11, at half-past 12 o'clock—

- A GRAND IMPORTATION of 1000 PLANTS of the BEAUTIFUL NEW SCARLET

ODONTOGLOSSUM NOETZLIANUM,

Just arrived in the best possible condition, among them being some extra fine masses.

We have succeeded, after many months' research, in securing the quantity offered. Most magnificent varieties will be flowered among them. For cut-flower purposes this grand Orchid will stand unrivalled, being one of the freest-growing species of the type.

On view morning of Sale, and Catalogues had.

Friday Next.

LÆLIA ELEGANS.

A consignment of various ORCHIDS, including 70 fine plants of LÆLIA ELEGANS, and a quantity of ONCIDIUM CRISPUM, from Brazil.

MESSRS. PROTHEROE AND MORRIS will include the above in their ORCHID SALE on FRIDAY NEXT, December 11, together with a quantity of established unflowered OdonTOGLOSSUM ALEXANDRE (best type), a fine lot of imported CYPRIPEDIUM SPECTABILE, CYPRIPEDIUM ACAULE, and established ORCHIDS, various properties.

On view morning of Sale, and Catalogues had.

Friday Next.

CATTLEYA TRIANÆ ALBA.

A consignment of about 100 plants. Imported from Columbia by Mr. R. THOMSON, many years Superintendent of the Botanical Department, Jamaica. Mr. Thomson says these white varieties were collected during a long residence in Columbia, and have been duly tested.

MESSRS. PROTHEROE AND MORRIS will include the above in their ORCHID SALE on FRIDAY NEXT, December 11.

On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will include in their ORCHID SALE on FRIDAY NEXT, December 11—

A fine consignment of RARE TERRESTRIAL ORCHIDS for cool house or frame, most of them very fragrant

DISA UNCINATA

offered for the first time. A pretty yellow species of the broad-leaved section to which D. grandiflora belongs. Tufts with healthy tubers as collected.

BARTHOLINA PECTINATA (the Spider Orchid),

flowers blue, handsomely fringed and sweet; DISPERIS CAPENSIS, rosy-purple; DISPERIS CAPENSIS LUTEA, yellow; DISPERIS DECIMIDA, pale yellow and green; SATYRIUM CARNEUM, the largest of the genus, and easily grown if treated like Hyacinths. Immense tubers of SATYRIUM CANDIDUM, the pure white fragrant species; SATYRIUM ERECTUM, yellow; DISA SPATHULATA, a most extraordinary species, with long spear-like lip, and other rare kinds.

On view morning of Sale, and Catalogues had.

Havant.

EXPIRATION OF LEASE. SECOND PORTION.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the Sea View Nurseries, Havant, on TUESDAY and WEDNESDAY, December 8 and 9, at 12 o'clock, each day, the SECOND PORTION of the particularly well-grown and healthy NURSERY STOCK, which is in exceptionally fine condition for removing, comprising about 8000 Ornamental Trees, 5000 Flowering and Ornamental Foliage Shrubs, 5000 beautifully grown Conifers and Evergreens; 3000 Fruit Trees, several thousands of Roses, for the growing of which, these Nurseries have a wide spread reputation, and a large stock of smaller Evergreens and Conifers suitable for the Trade for growing on.

May be viewed. Catalogues on the Premises, and of the Auctioneers, 67 and 68, Cheap-side, London, E.C.

Feltham, Middlesex.

Absolutely WITHOUT RESERVE.

A PORTION of the exceptionally well-grown NURSERY STOCK, by order of Messrs. C. Lee & Son, the ground being required for other purposes. The Stock is in magnificent condition for removal, having been recently transplanted with great care.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Lee's Nurseries, Feltham, Middlesex, on THURSDAY and FRIDAY, December 10 and 11, at 12 o'clock each day, without reserve, thousands of exceptionally well-grown Specimen CONIFERS, the whole of which have been transplanted with great care, and will remove with safety. Specimen Conifers are a special feature at this Nursery, and the Auctioneers desire to call particular attention of Gentlemen and others to this important item in the Sale. The Catalogue will also include a grand lot of Specimen GOLDEN YEW, 1500 CUPRESSUS RECTA VIRIDIS, 2000 ENGLISH YEW, 2 to 4 feet; 1000 HOLLIES, 1 1/2 to 4 feet; 1000 named and HYBRID RHODODENDRONS, 1 1/2 to 3 feet; and other Stock.

May be viewed any day prior to the Sale. Catalogues can be obtained on the Premises, at the Royal Vineyard Nursery, 2, Hammersmith Road, W.; and of the Auctioneers, 67 and 68, Cheap-side, London, E.C.

N.B.—In the event of frosty weather setting in, arrangements can be made for allowing ample time for removing the lots.

Charlton Nursery, near Shepperton.

One mile from the Shepperton Station, L. & S. W. Railway. IMPORTANT CLEARANCE SALE.

To Gentlemen, Fruit Growers, and others.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Bristow, who is relinquishing the Business, to SELL by AUCTION, on the Premises, as above, on TUESDAY and WEDNESDAY, December 15 and 16, at 12 o'clock each day, without reserve, the whole of the valuable NURSERY STOCK, consisting of about 15,000 choice Evergreen and Coniferous Shrubs, 600 Privet, 5000 Standard and Dwarf Roses, in great variety, including the finest kinds in cultivation; a good assortment of Ornamental Trees, and 10,000 Fruit Trees, including quantities of the best Market kinds of Apples, Pears, and Plums; and a large number of Gooseberries, Currants, Peaches, and Apricots, of special attraction to Fruit Growers.

Also, the LEASEHOLD NURSERY and FRUIT FARM, of about 37 Acres, with Cottage, Buildings, and Greenhouse, held for 15 years unexpired, at a Low Rental.

May be viewed any day prior to the Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheap-side, London, E.C.

East Dulwich.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, The Orchid Nurseries, East Dulwich, S.E., on WEDNESDAY, December 16, by order of Messrs. Seeger & Tropp, a fine lot of ESTABLISHED HEALTHY ORCHIDS, among which will be included many exceedingly well-grown specimens and half-specimens, also choice new, rare, and beautiful species and varieties, a large number of Orchids in bud or flower, and a splendid collection of Vandas.

Plants will be on view the morning of Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheap-side, London, E.C.

The Orchid Nurseries are within five minutes' walk of East Dulwich Railway Station, L. B. & S. C. Ry.

CHRYSANTHEMUMS.

Our whole aim and exertion is to grow and supply plants and cuttings in the highest possible condition, so that they succeed everywhere. It would gladden the heart of every veteran grower to see our houses filled with the finest stools, full of vigour (these were cut down six weeks ago, when out in the open ground), now throwing up the loveliest cuttings ever supplied, in perfect health and full of colour. It is really extremely important, however many cuttings exhibitors may have on their overfed exhausted plants, to have all they want for next season from our grandly-prepared stock, and 12,000 plants in pots specially prepared in the same manner for foreign transit. See following Testimonials of the great results from our importation to the furthestmost parts of the globe, and which have made us the largest exporters of these and all other plants and seeds:—

It is of the highest possible importance to have all your plants and cuttings from the sunniest and clearest atmosphere, and where they are grown close to the glass. Our present Stock is the largest and finest we have ever had.

Mr. E. ROWBOTTOM,
The Gardens, The Priory, Hornsey.
February 9, 1891.

"The Cuttings of Chrysanthemums I had from you last year secured me several prizes at Highgate: 1 came in for 6 Firsts, 1 Second, and 3 Thirds. At Hornsey, 7 Firsts and 4 Thirds; also First for 6 blooms of your Avalanche."

C. G. HOLLENBACH, Esq.,
Dehradun, N. W. P., India,
January 28, 1891.

"You will be much pleased to hear that all the Chrysanthemums despatched on December 30 last reached me in splendid condition."

G. VAN DEN BRINK, Esq., Curator,
Botanic Gardens, Utrecht, Holland.
February 6, 1891.

"Your Chrysanthemums have in Amsterdam received Three Gold Medals and Four Silver Medals."

G. L. ELLIS, Esq., Wadebridge, Cornwall,
January 8, 1891.

"Send on Chrysanthemum cuttings, as I can get none so strong and good as from you."

Send for ours, the finest and most correct ILLUSTRATED and DESCRIPTIVE CATALOGUE of the best kept Collection in the World.

H. CANNELL & SONS,

PAULS' NURSERIES, WALTHAM CROSS

CAMELLIAS

The Largest Stock in the Country.

Plants well set with Bloom-buds.

Also, AZALEAS, LAPAGERIAS, and other GREENHOUSE CLIMBERS.

Descriptive Priced CATALOGUE Free by Post.

PAULS' NURSERIES, WALTHAM CROSS

BULBS & SEEDS OF BEST QUALITY.

ALSO MUSHROOM SPAWN, GARDEN MATS, MANUKES, INSECTICIDES, and all other GARDEN REQUISITES.

Prices strictly moderate; reduced rates for large quantities. Inspection of stock invited. Goods packed by experienced hands for all parts of the world. Gardeners of character and experience recommended.

Important: Observe the Christian Name and Address—

WM. PAUL & SON, WALTHAM CROSS, HERTS.

FRUIT TREES—FRUIT TREES.

HUGH LOW & CO.

Offer, of good quality, and will esteem the favour of Orders:—
APPLES—Dwarf Maidens, Dwarf Trained, 2-yr. Untrimmed, Pyramids, Standards.
APRICOTS—Standard, and Standard Trained.
CHERRIES—Dwarf Maidens, Dwarf Trained, 2-yr. Untrimmed, Pyramids, Standards.
PEARS—Dwarf Maidens, Dwarf Trained, Pyramids, Standards.
PLUMS—Dwarf Maidens, Dwarf Trained, 2-yr. Untrimmed, Pyramids, Standards.
DAMSONS, FARLEIGH PROLIFIC—Dwarf Maidens, Pyramids, Standards.
PEACHES AND NECTARINES—Dwarf Maidens, Dwarf Trained, Standards, Standard Trained.
Quantity Large—Quality Good—Prices Moderate.
 INSPECTION INVITED.
 Bush Hill Park Nursery, ENFIELD.

SHARPE'S QUEEN PEA.

FINEST BLUE WRINKLED MARROW.
 BEST OF ALL FOR QUALITY AND COLOUR.
 FINEST FOR EXHIBITION.
 ALWAYS SUCCESSFUL.

W. Icetoo has a fine Stock of Asparagus plumosus nanus, in 48's and 60's; Pandanus Veitchii, Dracaena Lindenii, and Ficus elastica.—W. IOETON, Putney, S.W.

ESTABLISHED OVER A CENTURY.
 ALL KINDS OF NURSERY STOCK.
 SEEDS and BULBS (HOME-GROWN and IMPORTED).
 ALPINE AND HERBACEOUS PLANTS.
J. BACKHOUSE & SON,
 YORK.
 CHOICE INDOOR PLANTS.
 PALMS, ORCHIDS, FERNS, &c.
 IN GREAT VARIETY.
 PARK, ROCKWORK, & ESTATE PLANTING.
 OVER 100 ACRES OF NURSERY.

PAUL & SON'S

GREAT HARDY NURSERY,
 CHESHUNT, N.

Invite Planters to Inspect and Select from their Stock of

PAUL & SON'S CHESHUNT ROSES.

STANDARDS—Demand large. Early orders necessary.
 DWARVES—Virtually all on the accepted stock—the Briar.
 POT ROSES—The finest lot they ever held; therefore the finest in the world.
 ROSE SPECIES and SINGLE ROSES—A specialty of the Firm.

PAUL & SON'S FINISHED FRUIT TREES.

STANDARDS, more especially APPLES, the very finest in the Trade. From £12 per 100 downwards.
 PYRAMIDS, and all FORMED TREES, vigorous, and yet of best shapes.
 All SMALL FRUITS, to ALPINE STRAWBERRIES, carefully tended.
 Large Planters should see the Stock.

PAUL & SON'S HARDY TREES.

The variety of them is wonderful. By careful selection the smallest garden may be made a varied picture.
 From 18s. per dozen.

PAUL & SON'S HOLLIES & EVERGREENS

Of every description, are moved and do well—notably Hollies, of which there are 8 acres at the Epping Forest Nursery, from 2 to 12 feet, 1s. to 5 guineas each.

PAUL & SON'S AMERICAN PLANTS.

The free-setting RHODODENDRONS and AZALEA MOLLIS—specialty at the High Beech Nurseries.

PAUL & SON'S CONIFERÆ.

The most varied collection in England. Special selections of ROCK GARDEN SHRUBS, and for Villa Gardens.
 ARAUCARIAS in thousands, green and beautiful.

PAUL & SON'S HERBACEOUS AND ALPINE PLANTS.

For Borders, Rockwork, Cut Flower producing.
 An acre of ROCK PLANTS at the Broxbourne Nursery.
 ESTABLISHED 1807. Eighty-four years' continuous attention and application has made these Hardy Nurseries one of the most complete in Europe. Planters should see for themselves.

ROSE and other CATALOGUES on application to

 THE OLD NURSERIES, CHESHUNT.

(One Mile from Cheshunt Station, G.E.R.)

PRELIMINARY ANNOUNCEMENT.

LINDEN'S

GRANDEST DISCOVERY:

CATTLEYA REX,

JAMES O'BRIEN.

 THE MOST FAMOUS ORCHID EVER INTRODUCED.

J. LINDEN, the discoverer and first introducer of nearly all the finest Cattleyas in cultivation, viz.: CATTLEYA AUREA, AMETHYSTOGLOSSA, GIGAS, ELDERADO, TRIANE, WAROCQUEANA (LABIATA AUTUMNALIS), &c., confidently recommends—

CATTLEYA REX AS THE FINEST OF THE GENUS.

CATTLEYA REX flowers in December and January.

Some Amateurs have stated CATTLEYA REX to be a grand form of Cattleya aurea, with white sepals and petals, but it is a QUITE NEW TYPE.

CATTLEYA REX is described by JAMES O'BRIEN in the *Gardeners' Chronicle*, December 13, 1890.

Sepals and petals are creamy white. The labellum is of the richest crimson, of various shades—from the rosy hue to the purple tint—veined in a beautiful manner with golden yellow, all worked in to form a richly-colouring marbling. "*It is a Wonderful Piece of Colouring.*"

MR. R. JOHNSON, Stand Hall Gardens, Whitefield, Manchester, writes to MESSRS. LINDEN:—

"The CATTLEYA REX has flowered with us, and a grand thing it is. We have had some of the principal importers of Orchids here to see it: they think your plate in *Lindenia* (English edition, Part I., 1891) a true representation of the flower, but the lip of our flower is FINER than your Plate."

Messrs. Protheroe & Morris

Will shortly offer, at their Central Sale Rooms,

THE WHOLE IMPORTATION, JUST TO HAND, IN CAPITAL FINE CONDITION.

The plants have been collected by Messrs. LINDEN'S intrepid Collector, M. C. ELLNER, with the greatest difficulties, and who has searched, with hundreds of natives for two years, after this GRANDEST CATTLEYA, and only succeeded in discovering those offered. He states that "*it is impossible to find any more.*"

 A portrait made from a plant flowered in Monsieur WAROCQUE'S Collection, will be on view on the day of Sale. By order of

MESSRS. LINDEN,
L' HORTICULTURE INTERNATIONALE, BRUSSELS.

As a Supplement

Gardeners' Chronicle.

SATURDAY, DECEMBER 5, 1891.

SPYE PARK.

THROUGHOUT the length and breadth of Great Britain, with all its varying surfaces, it has always appeared to me that the most picturesque scenery was that of the lower greensand, cropping out from below the chalk, and often overtopping the adjacent ridges of that formation, as in the case of Leith Hill, near Dorking, which reaches a greater altitude than the highest points of the North Downs, higher than Box Hill, Newland's Corner, or the Hogsback, and higher even than Ditchling Beacon, Beachy Head, or any other eminence of the South Downs. The famous Surrey scenery of Dorking, Albury, Guildford, and Godalming, where so many persons find delight, and lodgings are so hard to obtain, and where quite a colony of artists has settled since the railways were built, and where, in the loveliest spot in Surrey, my natal village, I was as free to pursue my sports with rod and gun, when a boy, as Selkirk in his island, though now such privilege would be worth hundreds a year—the whole of that delightful district is on the lower greensand.

Spye Park, which I visited last May, is situated in that part of Wilts where this same picturesque formation borders on the Coral Rag of the Somersetshire Oolite. Bowood Park, 3 miles to the north, is partly on the Rag, but it owes its beauty mainly to the greensand, as does Longleat, further south, where the greensand—productive in Conifers and all kinds of shrubs—is as pleasingly unlevel as it is in Surrey. If I had engaged my trap at Devizes, instead of at Chippenham, I should have driven a distance of 5 or 6 miles to Spye Park in the greensand country entirely. It was in this pleasant country that Thomas Moore, pianist and poet, and "who dearly loved a lord," sang his own songs in the highest Whig society, which petted him for years, and left him poor. It was here he retired in much the same condition as the hare with many friends, one of these, the Marquis of Lansdowne, had asked him to Bowood to see

a house that would exactly suit him. It proved far beyond his means; but he wrote to his wife, "I have seen a cottage that will suit us."

Sloperton Cottage is in a lane as rural and retired as any poet could desire, three miles from Devizes, with the pleasing landscape of the greensand, all hill and vale, around it. The village of Bromham and the church, where "Tom Moore" rests from singing, are seen across a little vale in front, and on the left is upreared, some miles off, Roundaway Hill, which terminates the chalk range of the White Horse vale, and overlooks Devizes. Behind the cottage, across some fields, are the wooded slopes of Spye Park, whose embattled gateway, brought from an older house in the neighbourhood, is immediately opposite one of the entrances to Bowden Hill, the residence of Mr. J. E. Gladstone.

The owner of Spye Park is Captain Spicer, in succession to his father, who acquired the estate by purchase, and enjoyed the satisfaction of completing an improvement which Evelyn himself had suggested in his *Diary*, when he visited this place in 1654. At that time, Spye Park was owned by the distinguished family of Bayntun, whose seat had been previously Bromham House; and the importance of the new seat, and the size of the park, extending to 500 acres, are explained when I mention that the Bayntuns were a family of high position, of much greater consequence than mere country squires. Their chief seat, old Bonham House, was erected more than a hundred years before the time of Evelyn's visit to Spye Park, by Sir Edward Bayntun, Henry VIII.'s Vice-Chancellor. It was a despoiling age, when the favourites of Henry VIII., Defender of the Faith, often rose to sudden wealth by grants from the Crown, and sometimes lost it again. Devizes Castle and Corsham Manor House had been despoiled to furnish materials for building Bonham House, and the seat of its owners has been described as "nearly as large as Whitehall, and fit to entertain a king." Standing close to the great road from London to Bath, it was a convenient halting-place for people of fashion proceeding westwards. James I. was several times at Bromham, and used to hunt there in the Park. But in 1615, the king's forces had destroyed and burnt the great house, and this explains Evelyn's visit to the Bayntuns at Spye Park. The old family of the Bayntuns of Bromham, was destined to become extinct, and it seems that their talent and good sense were already waning. The "new house," which Mr. Spicer pulled down in 1868, was built of brick, and contained only one good room. Evelyn described it as "a place capable of being made a noble seat; but the humorous old knight has built a long single house of two low storeys, on the precipices of an incomparable prospect."

The present house stands a little behind the site of the older one, on rather higher ground, and commands the same fine view, extending due south before the best windows. Before these fortunate windows lies a stretch of country extending beyond Warminster and Trowbridge, towns lying a little to the left, the latter being a populous place, and showing its smoke by day, its lights by night. Melksham is 6 miles distant, due south. An interesting antiquity of the Park is the great Roman road, which passed from London through Oxfordshire, past Marlborough, and along the ridge of the Downs, overlooking the Vale of Pewsey. It came through Spye Park and some of the present shrubberies, but, I believe, no part of it is visible here now, though its course can be traced by the scorching

of the grass in summer on its site. The Park is exceedingly varied in contour. In driving through it on May 22, the lateness of the season was manifest in the foliage and the deficiency of flowers of the early-blossoming shrubs. The Hawthorn was not in blossom. My driver and I were deceived by a tree in the distance completely covered with white blossom. If the Whitethorn at Glastonbury could blossom at Christmas, as we read in the monkish stories, why not in Spye Park on May 22? But the gorgeous robe of white blossoms was merely the array of a Crab tree. The opening bud of the Crab blossom is generally, with some variation, richly tipped with scarlet, while the open blossom is as white as that of the whitethorn itself. There are some fine English Elms, and some extraordinary Oaks in the Park. There are deer, as befits an ancient enclosure of the kind, as well as a kennel of foxhounds, Captain Spicer being M.F.H. I believe there are fifty or sixty horses in the stable in the season—the more the merrier, most people would say; and each pair of horses requires, probably, one man to attend to their luxuries and comforts. A sensible country labourer finds in this arrangement grist for his mill, but I heard an orator on Peckham Rye object to the luxuries of the rich. In the good time coming there will be no pheasants to be fed, no hunters to be groomed. Society, the orator declared, required reorganising in every detail. It happens that in some parts of Wilts the landowners have lost their rents, and the labourers have wanted work; and when some wealthy trader has bought a property to reside on, and has set the people to work, and promoted industry, gardening, and sport, the people have welcomed him as a reorganiser, just such as they required. So long as thrift sets its shillings aside, capital must grow, and capital—which is but stored-up labour—is as necessary as industry.

Close to the stables is a newly-formed shrubbery, immediately below the site of the old house, and partly on the "precipice" mentioned by Evelyn. The shrubs will soon secure for this spot a pleasant seclusion, such as most persons find sometimes agreeable. In passing from the house to the stables, the path takes its winding way through the new shrubbery. The head gardener, Mr. Perry, took me to this scene of his recent labours by a short cut, and after admiring his excellent arrangements for clothing the precipice, we returned to the house by the new way. This brought us to the principal lawns, on the south-west side, which I had not before seen, and which were laid out very tastefully on the building of the mansion twenty-three years ago. The site is new, but the park is old, and there are trees standing on the lawn many hundred years old, and Portugal Laurels whose size and vigorous growth show how well the soil suits them. On the south side, a terrace with wall and balustrade is interposed between the house and park, the terrace being covered with lawn and flower borders, and its wall with various shrubs and creepers. A house is almost as much improved as the human figure by the addition of appropriate drapery, and as creepers on the walls of a big mansion are scarcely sufficient, a terraced garden, with draped walls and balustrade, is desirable, provided the house stands high, as it does here, so that the landscape may not be shut out. It is a handsome three-storied red-bricked house, with turrets and gables, and several large bay windows breaking the otherwise straight lines. The effect of the architecture is very pleasing, and the creepers, which cover a large portion of the walls, have greatly

assisted that wondrous painter, Father Time, in sobering their red tints.

The present owner is effecting a curious reform in replacing the plate-glass windows of his house with old-fashioned casements, glazed with small panes of glass in lead. I think most impartial people will admit that nothing can be uglier in the walls of a big house than a series of square holes, equidistant, for the most part, and each filled with one or two great panes of glass, without much relief or variety in the mouldings of the windows. Casements in the old style are much handsomer. It has always seemed to me an absurd objection to casements, that they shut out the view, as if people went into a house to stare out of the windows. It is true that persons are sometimes prevented from going out-of-doors by ill-health, broken legs, or other causes, and a few big panes might be very properly reserved for their use. But that is quite a different matter to the uncomfortable extreme of modern times, which in some cases—in some modern villas, with huge bay windows, all pane and no mullion—is carried to such excess that one might almost as well occupy a glasshouse which all the coals at Newcastle would hardly keep warm.

The kitchen gardens were formed fifteen years ago, just outside the Park, and Mr. Perry had reason to be proud of a good crop of wall fruit, including Plums, well set and safe, in spite of the frosts. The Potatos were cut to the ground a few days before my visit. The Melons were ripening in their house, and the plants looked so well that I inquired as to their culture. They were growing on a dung-bed having below them a good stiff fibrous loam, taken from the Park and stacked till the grass and roots were partly rotted, and then well trodden together in the frame. In an adjoining stove, Tomatos had been cut all the winter, the two favourite sorts for winter forcing being Horsford's Prelude and Ham Green Favourite.

It is worth remark, that in one of the stoves two Tree Ferns had the whole of their otherwise naked and rather unsightly stems beautifully covered with *Selaginella*. Mr. Perry recommends *Acalypha macrophylla* for its decorative foliage—superior to *Coleus*, which, although a stove plant in winter and spring, does well when established in the greenhouse during the summer, when the fine colours of the leaves become well developed. I must pass by the Orchids and Ferns, and the Cockscombs and Celosias in full blossom, and the large pots of *Pelargoniums* waiting for their allotted places outdoors. I paused among the pits, but must not add the lesson of their management to this long article. There were 500 *Chrysanthemums* in pots. The Violets and early Lettuces were over, and the lights removed. Potatos and Carrots were coming on, and a large stock of bedding plants was here under protection. The work of this large establishment is exceedingly well done, and only ten gardeners are employed. They could not do the work if the lawns and flower gardens were not comparatively limited in extent.

Instead of returning to Chippenham, I was driven to Melksham station, which is more convenient for Warminster, where I stopped a night; in order to visit Longleat the next day. On descending Bowden Hill, the young leaves of Oak and Ash on the lower level had been blackened and destroyed by the recent frosts, while the same kind of foliage in the drier atmosphere of Spye Park retained all the freshness and beauty of the young leaves, Potatos only having suffered. H. E.

NEW OR NOTEWORTHY PLANTS.

EPIDENDRUM PUSILLUM, Rolfe, n. sp.

This is a small and interesting species of Epidendrum, which has been sent to the Editor of the *Gardeners' Chronicle* on two occasions for determination, but which I have failed to identify with any existing description. It is said to have been received from Brazil. The pseudobulbs are ovoid-globose, about 5 or 6 lines in diameter, each bearing a single thick, fleshy, and very narrow leaf, about 5 inches long. The raceme seems to be reduced to a single flower, borne from the apex of the pseudobulb on a slender peduncle; but from the presence of a small barren extension of the latter and an empty bract, I infer that a stronger plant would develop a raceme of at least two or three flowers. The bract is lanceolate-ovate, acute, and 2 lines long. Sepals lanceolate, acute, 9 lines long by 2-2½ lines broad, light yellowish-green, irregularly freckled with light brown. Petals oblanceolate, apiculate, otherwise like the sepals. The lip is free from the column, three-lobed, and 7 lines long; the side-lobes, oblong, are acute, a line long, very pale green; the front lobe unguiculate, the blade broadly suborbicular, minutely apiculate, 3 lines broad, pink with some pale lines radiating from the disc; the base of the narrow claw is furnished with a pair of white, fleshy longitudinal keels. Column clavate, 3½ lines long. It belongs to the section *Encyclium*, and may be placed near to *E. tampense*, Lindl., with which it has some affinities. *R. A. Rolfe, Herbarium, Kew.*

APPENDICULA PEYERIANA, n. sp.*

The genus *Appendicula* is not very frequent in our collections. We received fresh materials from Mr. Ortgies, of the Botanical Garden at Zurich, Switzerland, to whom it was given by Mr. Peyer. We are indebted to this gentleman for many very interesting introductions from Sumatra of old, half-forgotten species, and we are very glad to have the opportunity to dedicate to him this new one. Imagine a small Dendrobie, with long, tender, drooping branches, with nearly opposite leaves, and two or three little white flowers, enclosed in somewhat showy white leaves or bracts on the top of the branches. you will then have a true idea of this plant. *Dr. F. Kränzlin.*

CHRYSANTHEMUM NOTES.

In visiting a few of the leading Chrysanthemum exhibitions during the season, I generally look out for any novel methods of exhibiting the plants, or signs of improved cultivation; but very seldom is any advance of this kind noticeable. There are the usual cut blooms, Japanese and incurved predominating; generally the Japanese are exhibited just as they are cut from the plants, but the incurved blooms are dressed. This is a well-known and legitimate practice; but the deformed petals are removed, and those petals with a tendency to reflex are made to incurve. Sometimes the work is very tedious. I know one exhibitor who spent an afternoon in manipulating one bloom before he could get the petals to assume the incurved form. There is no use to conceal this practice of the florist; some condemn it as being absurd, but it is done by all Chrysanthemum exhibi-

tors. The legitimate part of it consists in removing any malformed petals, and incurving those that remain; it is illegitimate to add anything to the flowers. In the early days of exhibiting, two flowers have been used in the formation of one; and one case has occurred this year where gum was used to close the centre petals together—that, I should say, is an illegitimate practice.

There does not seem much probability at present of any improvement being effected in the mode of exhibiting cut blooms, except that the stands for Japanese should perhaps be made a little larger. The distance at present is 6 inches from centre to centre of each bloom; this should be increased by an inch, which would make the stands of twelve blooms 4 inches longer and 4 inches wider. This is a very important matter for exhibitors, because they will be put to the expense of providing new stands, and travelling boxes of larger dimensions. Most Chrysanthemum Societies confine exhibitors' stands to 24 by 18 inches. The National Chrysanthemum Society wisely places no limit to the size of the

or £147. But the question of the introduction of this superb variety is of great interest, as it foreshadows a marvellously beautiful series of new varieties totally distinct from any of the old forms of *C. insigne*, and a great variety of which are already to be seen in flower at St. Albans. It appears that, a few years ago, Mr. Sander sent a collector to search the hills of Northern India, especially the higher altitudes, for a special purpose. While doing so in several districts, very high up, he found *Cyrtipedium insigne*, which, owing to their being advised as distinct, and to their being collected at high elevations, Mr. Sander included under the denomination *C. insigne montanum*, and under that name he sold a quantity which, in different places, have produced novelties which he has been only too glad to buy back. At St. Albans, however, appeared the most delicately beautiful specimen, and it was dedicated to Mrs. Sander. Lately appeared the beautiful *C. i. Bohnhofianum*, which is in the way of *C. i. Sanderæ*, but with purplish-brown base to the dorsal sepal, and a similar hue over the petals. Some of the forms which have flowered out of *C. i. montanum* have the whole flower suffused with a chocolate tinge and veining, except the white tip of the dorsal sepal; others have but six or seven large and nearly black blotches on the upper sepal, while many have but few dark spots on it, but the showiness is made up by from nine to fifteen carmine-crimson blotches beneath the pure white margin of the sepal. Indeed, it is difficult to find two alike, and it seems curious that the same importation should include the unspotted and untinged *C. i. Sanderæ*; the unspotted, but still tinged with purplish-brown, *C. i. Bohnhofianum*; and those numerous heavily-spotted varieties which are much darker and more richly coloured than any of the old *C. insigne*. Practically, there seems to be no limit to the variations and beauty of these forms of *C. i. montanum*.

FIG. 96.—CYPRIPEDIUM INSIGNE VAR. SANDERÆ.

Japanese stands, but limits the others. I think, however, the stands for Japanese ought also to be defined, and I believe 28 by 22 inches would be a good standard for them. *J. Douglas.*

CYPRIPEDIUM INSIGNE SANDERÆ.

Our illustration (fig 96) gives a representation of this most beautiful variety, whose clear shining yellow and snow-white wax-like unspotted flowers cause such admiration wherever they are seen. In our issue of November 21, p. 618, we give the commercial side of the question, by which it appears that the lucky importers, Messrs. F. Sander & Co., sold the plant in two portions at 70 guineas each. As the two plants gained in strength, their flowers increased in beauty, and their fame spread abroad until at last Mr. Sander, who has always been striving to get a portion of the plant back again, was glad to have his wish gratified by paying £250 for what was practically an eighth part of that which he originally sold

ORCHID NOTES AND GLEANINGS.

DENDROBIUM PHALÆNOPSIS.

This remarkable Orchid, figured in a recent number, is the subject of comment by Mr. Watson, in *Garden and Forest*, for November 4, p. 521, and he speaks of it as the most beautiful of all the *Dendrobiums* hitherto introduced from Northern Queensland and the adjacent islands. It was discovered at Cape York, on the extreme north of Queensland, by a Captain Broomfield, who introduced living plants of it into his garden in Balmain, Queensland. Here it flowered, and was figured by Fitzgerald in his folio work on *Australian Orchids*. He also sent a description of it to the *Gardeners' Chronicle* for July 10, 1880. His figure represents a plant with pseudobulbs 18 inches long, terminal, erect racemes, produced from the matured pseudobulb, the longest raceme being 1½ feet long, and bearing ten flowers and buds. The flowers measure 2½ inches across, and they are described as being lilac in colour, with a few small dark calli on the disc of the labellum, and two white glands at the base of the column. There is a family likeness between *D. Phalænopsis* and *D. bigibbum*, *D. superbiens* and *D. Goldiei*; but, as Fitzgerald points out, the first-named is easily distinguished from these three in the form of its flowers and the shape of the labellum. The name *D. Phalænopsis* was given by Fitzgerald from the likeness of its flowers to moths as well as to those of the genus *Phalænopsis*. The plant in Captain Broomfield's collection flowered the following April, and produced 300 blooms.

In 1882, Mr. Forbes visited some of the islands north of Queensland, on behalf of the Geographical Society of London. He brought back with him several living plants, and among them was a plant of this *Dendrobium*, which he obtained in Timor Laut. This plant came to Kew, where it flowered in September, 1884, and a figure of it was published in the *Botanical Magazine*, t. 6817. There is a decided difference between the plant flowered

* *Appendicula Peyeriana*, n. sp.—Affinis *A. callosæ*, Bl. Sepalo dorsali triangulo acuminato truncato, carina mediana in apicem producta, lateralibus longioribus in pseudoclearippo et ovario inquilongum elongatis dorso manifestius carinatis; petalis lateralibus sub-similibus paulo minoribus, medium usque tantum leviter carinatis; labello paulum longiore late linearis antice sub-patulo convulso calli 2, pone marginem antice in disco confluentibus ibique evanescentibus instructo; gynostemio e basi latissima dorso angustato apice bidentato; anthera 2-loculari acuminata purpurea; pollinibus 6 roseis; rostellulo bidentato.—Caulis tenuis subcompressus vaginis foliorum non dentatis vestitus. Folia oblongo-linearia antice sub-oblique biloba medio apiculata, 1 cm. longa, 2 mm. lata. Inflorescentia terminalis pauciflora (biflora, an semper?); bracteis paleaceis oblongo-ovatis obtusis aristulatisque albis pallide roseis vestita. Flores albi subcompressi sepala petala labellum ad 3 mm. longa, sepala in pseudocalcar 3 mm. longum elongata. Ex insula Sumatra importari jussit Dominus Peyer, v. cl. Turicensis.

at Kew and that figured and described by Fitzgerald, the scape of the latter being erect, while that borne by the Kew plant was pendent; the lip of the latter was maroon-crimson, whereas Fitzgerald figures and describes his plant with uniformly lilac-purple flowers. However, Sir Joseph Hooker considered and described them as identical. Several plants of *D. Phalaenopsis* had been distributed from Kew, and these are now known as the Kew variety, to distinguish them from an exceedingly beautiful form of the same species. This was named *D. Phalaenopsis* var. *Schroderianum*, by Reichenbach, in compliment to Baron Schroder, in whose collection it first flowered at Egham, near Windsor. He procured it from Messrs. Veitch & Sons, who had imported several plants of it through the Rev. Mr. Macfarlane, a missionary in North Australia. Mr. Lee, of Leatherhead, also obtained a plant from Veitch, who bought it back again for 50 guineas when Mr. Lee's plants were disposed of by auction. This plant also went into the collection of Baron Schroder, who was till lately the sole possessor of the variety. This is certainly a very beautiful *Dendrobie*. There is a figure of it in Williams' *Orchid Album*, iv., t. 187. It has flowers half as large again as those of the Kew variety, and the colour is much deeper and richer. Until this week, *D. Phalaenopsis* was coveted by all who had seen it as exhibited in flower last spring, but Mr. Sander has lately imported a large quantity of what he declares to be the same as Baron Schroder's variety, and has disposed of nearly a thousand plants by auction.

The plants were in very good condition, many of them having young growing shoots. Some of them had pseudobulbs over 3 feet long, one I measured being 43 inches, and as thick as a man's thumb. Others had thinner and shorter pseudobulbs, and were more like what we had hitherto known as *D. Phalaenopsis*. Altogether, there was very considerable variation in the length, thickness, shape, and colour of the pseudobulbs on the plants sold. I noticed, too, that the old flower-scapes were nearly all erect; certainly not one was what might be called pendent. If these plants are really *D. Phalaenopsis*, then it is a very variable species. Some of the dried scapes exhibited were nearly 3 feet long, and bore scars of twenty flowers. Dried flowers were also on view, and they were nearly 4 inches across. Mr. Sander says that there are varieties with white, rose, and crimson, as well as purple flowers, among those sold. [See our notes on the plants in flower at Messrs. Sander & Co.'s, *Gardeners' Chronicle*, p. 577, November 14 last].

D. Phalaenopsis requires plenty of heat, sunshine, and moisture—far more than suffices for *D. nobile*; in this respect it does not differ from its near relatives, *D. superbiens* and *D. biggibum*. At present I am inclined to believe that *D. Phalaenopsis* as figured and described by Fitzgerald is not the same species as that figured in the *Botanical Magazine* under the same name, and also that Mr. Sander's plants are likely to include both these, besides, probably, other forms.

ODONTOGLOSSUM ASPERSUM AND O. YOUNGII.

Odontoglossum Youngii is a somewhat curious Mexican *Odontoglossum*, which was described and figured a short time ago in the *Orchid Album*. The following interesting note from Reginald Young, Esq., Fringilla, 3, Linnet Lane, Allet Road, Liverpool, shows it is an abnormal state of *O. aspersum*. "In November, 1889," he writes, "a plant purchased as *Odontoglossum aspersum*, and not flowered in this country, produced a spike bearing two blooms, different in many ways from anything I had hitherto seen, and which Mr. Williams considered good enough to figure in his *Orchid Album* under the name of *O. Youngii* (vol. ix., t. 406). This picture I consider faithful as to size, colouring, and formation of lip. The 1890 pseudobulb was quite equal to its predecessor, but threw up no spike; and now, in October, 1891, with a stronger pseudobulb, and a spike bearing four flowers, the blooms open as a really fine form of *O. aspersum*, and they are very distinct from the blooms of 1889. I send you one of the flowers now open (there is no possible chance of a mistake

as to the plant)." The flower sent is a large, well-developed *O. aspersum*, and thus proves that *O. Youngii* is not a variety of that species of *Odontoglossum*, but simply an undeveloped and abnormal state of it. It is very interesting to be able to clear up this point. *R. A. Rolfe, Herbarium, Kew.*

ORCHIDS AT MESSRS. JAMES VEITCH & SONS.

At the Royal Exotic Nursery, King's Road, Chelsea, a more than usually fine display of new and rare Orchids are now in flower. Among the most beautiful of these should be noted *Cattleya Harrisii* ×, a showy thing, and one of the handsomest of its class. It was obtained by intercrossing *Cattleya guttata Leopoldii* and *C. labiata Mendelii*. The flower is 6 inches across, the sepals and petals light purplish-rose with a few purple dots; the showy labellum has the broad flat front-lobe and the tips of the side-lobes of a bright amethyst-crimson, the remainder of the lip being white. Its habit is compact, and it may be said to be better than even the best form of *Lælia elegans Turnerii*, which in some respects it calls to mind. Next comes that marvellous hybrid *Cypripedium* raised by Messrs. Veitch, viz., *C. macrochilum (longifolium ♀ Lindenii ♂)*, illustrated in the *Gardeners' Chronicle*, September 19, p. 343. The variety now in flower differs slightly from that which received a First-class Certificate at the Royal Horticultural Society, being lighter in colour, but the same elongated and curved form is to be seen in the extraordinarily large and beautiful labellum. Among *Dendrobiums*, the beauty rests with the exquisitely lovely forms of *Dendrobium Phalaenopsis* var. *Schroderianum*, whose delicately-tinted and variously-coloured flowers, borne on gracefully arching sprays, leave nothing to be desired. Among the forms in bloom are two whose flowers are white, delicately tinted in the one case with lilac, and in the other with rose, and with some very pretty markings on the lip. Another variety has a rich purplish-crimson base to the labellum, and in each form there is some specially attractive feature. The old *Cœlogyne Gardneriana*, too, here appears in fine condition, one plant having several long drooping racemes of pure white flowers, with light yellow in the centre. *Lissochilus Krebsii* also appears finely bloomed; the elegant little *Dendrobium Fockschii*, a neat and pretty object; and the number of plants of the white *Lælia autumnalis alba*, either in flower or bud, demonstrates the fact that, although rare, it is still obtainable.

Among the *Cypripediums*, over twenty-five rare species and varieties are in bloom, some of them in large specimens. Among them the handsome *C. Niobe* ×, a neat and attractive form, as are all the progeny of *C. Fairrieanum*, is one of the best, although *C. T. B. Haywood* × and *C. orphanum* × are bold and striking flowers, and *Selenipedium Cleola* × one of the whitest of these, and one which will make a great name when it acquires age. Other noteworthy varieties are *C. obscurum* × and the many forms of *C. Leeanum* ×, one of which was the first plant to flower out of Messrs. Veitch's batch of seedlings of it, and it is yet distinct from any other which has appeared, especially in the form of the dorsal sepal, which is much longer than usual, the basal portion, which is coloured green, being narrowed, the expansion of the blade taking place only as the white appears, the labellum thus having an elongated base.

The warm houses have a very fine show of numerous specimens of *Phalaenopsis amabilis* and others of the smaller species; many *Vanda cœrulea*, a quantity of the useful *Calanthes*, of which the best forms of *C. Veitchii* are the chief; various species of *Vandas*, and especially a noble lot of *V. Amesiana*, literally bristling with flower-spikes, which promise a fine show of flowers till we are well through the winter.

In the pretty rockery-house, the forms of *Vanda tricolor* and *V. suavis* are found to thrive marvellously around the sides, by reason of the uniformly cool temperature they enjoy in that situation, and the whole of the sides of the house are being furnished with them, some of the specimens being 4 or 5

feet in height, with leaves down to the pots. In this house, which is always prettily arranged with Orchids in flower, is a form of the old *Cymbidium giganteum* of a marvellously rich colour, the markings on the lip being as near to scarlet as the texture of the flower will allow; also some pans of the best forms of *Sophranitis grandiflora*, the elegant *Epidendrum dichromum*, the fine orange-scarlet *Cochlidia Noezliana*, some good *Lycaste Skinneri alba*, *Lælia autumnalis*, in several varieties, including the white one; some good masses of *Masdevallia tovarensis*, the curious *Polystachya laxiflora*, *Odontoglossum Bictoniense album*, some effective pans of *Pleione maculata*, *Cymbidium Mastersii*, the fragrant old *Maxillaria picta*, covered with flowers; *Maxillaria grandiflora*, and many of the Brazilian *Oncidium*s.

In the *Odontoglossum* houses the bloom is mostly found on the noble old specimens of *O. Pescatorei*, although there are many others in flower in lesser quantity; and the new *Dendrobium houzei* have answered excellently well, the plants having put on very fine growths, and are making up well for bloom.

ORCHIDS AT MESSRS. PITCHER & MANDA'S NURSERIES.

The British branch of the enterprising firm of Messrs. Pitcher & Manda, of New York, viz., the United States Nurseries, Hextable, Swanley, Kent, is devoted mainly to Orchids, and rare and valuable species are more prominent there than large batches of the ordinary kinds. In *Cypripediums*, more especially, the establishment shines, and many of the varieties now in flower are of great merit. Foremost among these must be mentioned the handsome *C. Masereelianum* ×, which, although many regard it as only a form of *C. Leeanum superbum* ×, is certainly the very best of its class. The large flat white dorsal sepal of this handsome plant has rich purplish crimson blotchings on the lower half, and from all points it is good, and superior to any of its class. Near the plants of *Masereel's* variety in flower stand a plant of the handsome *C. Leeanum* × *Burford* variety, and beside it the ordinary *C. Leeanum superbum*, but none so handsome as the first-named. Another special form peculiar to the United States Nurseries, is a form of *C. Arthurianum* ×, with crimson spotting on the white in the upper part of the dorsal sepal. This distinct form, too, seems of very sturdy and floriferous habit. In the same house is the plant of *C. Arnoldianum* × (*concolor* × *superbiens*), which was illustrated in the *Gardeners' Chronicle*, November, 1890, p. 633; and among other fine varieties in bloom in more or less quantity, we noted *C. Ashburtonianum expansum* ×, *Cookson's* var., the best of its class; *C. A. calcapilum* ×, *C. Sallierii Hycanum* ×, *C. tonsum* ×, *C. superbiens*, *C. calurum Rougierii* ×, and others of the *C. Sedenii* × section; *C. marmorophyllum* ×, and *C. m. superbum* ×, several fine forms of *C. Harrisianum* ×, *C. ænanthum superbum*, and a very complete and varied series of varieties of *C. insigne*, including *C. i. punctatum violaceum*, and the no less beautiful *C. i. Philbrickianum*.

The first of the block of six neat houses contains good healthy *Lælias* and *Cattleyas*, among which in bloom were several very richly-coloured autumn-flowering *Cattleya labiata*, one of them having variegated petals; also a large number of *Lælia albidia*, one grand form having large white flowers, with only a line of yellow in the lip, and without the rose tinge usually found in some part of the flower of this species. In this house also a good *Lælia purpurata* and a chastely lovely *Phalaenopsis leucorrhoda* were in bloom.

The next two houses chiefly contain healthy plants in large quantities of all the leading species of *Sarracenia*, and the fourth range is filled with good, freshly-imported *Cattleyas*, of the forms of *labiata*, principally; *Epidendrum vitellianum majus*, *Odontoglossum crispum*, and *O. vexillarium*; and the fifth also has many batches of freshly-imported Orchids, together with a quantity of sturdy *Odontoglossum citrosum*, making up well for flower; *Sophranitis grandiflora*, with many of their bright

scarlet flowers; and a good selection of Masdevallias and other cool-house Orchids.

The sixth range, in two divisions, is loftier than the others of the block, and is used for displaying the plants in flower, which do not suffer by removal from the houses in which they have been grown. In the present instance, the regular occupants of the house furnish the necessary display most liberally. Nearly the whole of the first division is filled with the flowering plants of that variety of the *Lælia autumnalis* section, imported by Messrs.

beautiful introduction of this firm, with white flowers, with just a faint pearly blush over them. The variety is good, but not to be compared with the pure white form, of which there are also some plants.

The fine new Chrysanthemum-house, 100 feet in length, was a gorgeous show, with the favourite flower of the season, among which H. Ballantine, W. A. Manda, and Geo. W. Childs, were conspicuous; and some of the yet unnamed kinds possess great merit, and are destined doubtless to make their way with *celat*. Among other

weekly from many parts of the Continent of Europe, as well as from districts of Great Britain and Ireland, that the Bordeaux Mixture is perfectly trustworthy for these purposes, when it is applied at the right time and in the right way.

A Belgian experimentalist—M. Edmond Laplace, an official in the State Agricultural Service—said in a letter last week, when describing the result of the dressings he had carried out, "They are undoubtedly the most precious application of science

FIG. 97.—VIEW IN THE TOPIARY GARDENS, LEVENS, WESTMORELAND. (SEE P. 671)

Pitcher & Manda, and named *L. Arnoldiana*. Its spikes are more slender than those of the typical *L. autumnalis*, and bear from three to seven flowers each. The flowers are rather smaller than those of the *L. autumnalis* generally seen in cultivation, and vary from white tinted with rose colour to bright rosylilac. It is evidently a most profuse bloomer, and the countless spikes of it arranged with other Orchids, as here seen, make a very fine display. With them are some good forms of *Lycaste Skinneri*, many of *Lælia anceps* in bud, *L. autumnalis*, and a plant of *Lælia autumnalis* Forstermanni, another

plants, the pure white compact-growing perpetual Carnation *Lizzie McGowan* is a grand thing, and seems to possess all the qualities which the most exacting florist could demand.

THE POTATO - DISEASE QUESTION.

It is now fairly established, I think—at least, it is in my mind—that a remedy has been found for this pest, which has been so destructive since 1845. There is conclusive evidence arriving

to agricultural purposes that has been discovered for many years."

As to the value of the Bordeaux Mixture, that may, I think, as I have said, be taken for granted. But from the evidence of some of the experimentalists in our own country, certain practical suggestions have occurred which are worthy of attention at once, that we may be duly prepared for applying the dressings with effect during the Potato-growing season of next year. One of these is, to my mind, of immediate consequence.

I refer to the selection or reservation of suitable

Potatoes for planting next spring. If this is not done, a grower of several kinds may sell the stock he ought to plant, and keep the kind that will produce a crop which will be unsuitable for dressing with Bordeaux Mixture. The quantity, according to soil and other conditions, will henceforth depend on the efficient manner in which the crop will admit of the Mixture being applied to its leaves and stems. There have been many crops this year where it was impossible to satisfactorily dress the whole of the fields. It will be the same in years to come where Potatoes are required to yield a heavy weight, and thereby leave a profit over labour and fixed expenses; 4 or 5 tons to the acre will not do this, therefore it is necessary to highly manure the land that double that quantity, or more, to the acre may be produced.

This is where the danger comes in with some sorts, either because they will not suit some districts, or because they will grow long stems and heavy foliage almost anywhere when highly manured. The aim, henceforth, must be to plant kinds, the habit of which is to produce stout stems with the length of them as short as possible. These points were not of much importance in the past if the crop remained healthy. But when the disease appeared it almost invariably occurred that the crops which promised just previously to be most prolific were the ones that were nearly or totally destroyed.

The object in future, therefore, must not be to grow excessively heavy crops and thereby court or invite the disease, but to grow a fairly heavy crop in which the disease may be prevented or speedily cured on making its appearance. Look at some of the facts we have already before us. The losses from diseased tubers on undressed plants have varied according to their kind, and the conditions of the soil on which they grew, from 30 or 40 to 80 per cent. The heavier losses, I am informed, were in fields, or on patches where the stems were excessive in length, and lay across the furrows. In these cases, too, where much trouble was taken to dress them as well as possible by the operator with a hand-machine, picking his way along, there were mostly many diseased tubers. But this should not be, if every plant gets a thorough dressing. If, say, the disease can be prevented in fifteen plants out of twenty, it is quite clear that the other five might have been saved, had they received the same efficient dressing as did their fifteen neighbours.

Quality, of course, should be the chief consideration in Potato growing; but equally important now is the habit of growth of their stems. The future object must be to grow sorts which will admit of machines passing through them that will cover four or five rows at a time as long, or as late, as there is any danger of an attack or renewal of disease. In Great Britain and Ireland last year, there were upwards of 1,000,000 acres of Potatoes. To dress this vast area over twice or thrice in the limited time when it would be successful, would require all the soldiers in the kingdom, in addition to a large number of the farm labourers, who at the time will be urgently required for other work.

This choice or reserve of suitable stocks for soils and districts can only be made by Potato growers who have had experience in each district. For example, Scotch-grown sets may be planted for a main crop the first year on the Wolds of Lincolnshire and Yorkshire, and other high ground, without fear of their growing stems so long and leaves so heavy as to smother themselves. But in Kent, Surrey, and other southern counties, the same sets would produce excessive tops and no marketable tubers, technically called "ware." As I have intimated, the quality and weight of crops, where Potatoes may be grown in wide areas or large fields, will depend on the facility and completeness with which they can be dressed by some form of machinery that will go over $1\frac{1}{2}$ or 2 acres an hour. But excessively long stems cannot possibly be divided and raised so that they will not be greatly injured in the attempt, and in the way they will be crushed by the wheels of the machine, by the feet of the animal drawing it, and of the man and boy in attendance. From this it would seem that

instead of planting sets of any stocks that were grown in a more northern or colder climate, it may be advisable to take sets from southern to northern districts. Anyway, the greatest possible care must be exercised for the purpose of producing such stems and foliage as will admit of the disease being completely prevented or cured by a uniform application of the Bordeaux Mixture at the right times. Thus, it will be better to aim at growing eight tons an acre, with the certainty of being able to keep them free from disease, than to attempt to grow ten or twelve tons an acre, with the risk of a large proportion of them being diseased, from it being impossible to thoroughly apply the great modern discovery in question.

Taking these views, I think Potato growers in a large way will see it is advisable for them to fall back on their experience of different kinds, and reserve for planting next year such varieties as produce stout short stems. *W. W. G.*

CONTINENTAL NOVELTY.

CALAMPÉLIS SCABRA VAR. ROSEUS (ECCREMOCARPUS).

The orange-red flowered variety of this pretty climber is very suitable for covering low fences and small arbours, as well as for forming living garlands. During the past year I have seen in Messrs. C. Platz & Son's nurseries at Erfurt, a plant whose flowers had changed from the usual colour to a beautiful salmon-pink. This variety has proved to be thoroughly constant in colour, and the above-named firm intend to offer it to the trade next season. The culture of Calampélis is easy; the plant growing almost in any soil if the position be a sunny one, flowering abundantly the whole summer and late into the autumn. *Johs. Mahling, Erfurt, Germany.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

BEAUTIFYING CARRIAGE DRIVES.—There are many nooks and open spaces in close proximity to carriage-drives which, by planting thereon alternate clumps of good varieties of Rhododendrons, evergreen and flowering trees and shrubs, would be considerably improved. Where there is a good expanse of turf on either side, such beds or belts should be made of a good size, irregular, and at fairly wide distances apart. Among the flowering shrubs, the Weigelas should be included, also plant due quantities of Scarlet Oak, Japanese Maples (see p. 615), and other subjects, which are noted for the beauty of their autumnal tints. The ground should be prepared in the manner indicated in the Calendar for November 14, p. 582, and the trees and shrubs put pretty closely together for immediate effect, subsequently thinning out and transplanting them elsewhere before they get much crowded.

BRIARS FOR BUDDING ROSES.—The present is a good time to collect Briars as stocks on which to bud Roses next July. Those with clean stems, about three-quarters of an inch in diameter, and from 3 to 4 feet high, should be selected. Having trimmed the roots of each Briar, plant them in rows 4 feet apart, and at 6 inches apart in the row; tread the soil firmly about the roots in planting, and then lay on a surface-dressing of short-dung or leaf-mould as a protection from frost. Cuttings of the Manetti and Bourault stocks should also be prepared, and planted in rows from 2 to 3 feet apart, and at 6 inches in the row, for working up a stock of dwarf Roses.

ROSE CUTTINGS.—Cuttings taken off with a heel may now, if not already done, be put in, in rows about 9 inches apart, and at 2 inches in the row on a north or east border, where the soil is light and sandy. The cuttings, about 9 inches long, may be inserted 5 or 6 inches deep, pressing the soil firmly. Cuttings may also be inserted in pots or boxes filled with sandy soil, watered, and placed in a cold pit or frame, putting them in heat in the spring, and potting off singly into 3-inch pots as soon as they are well-rooted.

PRUNING DECIDUOUS TREES AND SHRUBS.—Any deciduous trees and shrubs that require their shoots thinned out and shortened back, should be seen to forthwith.

CLOTHING TRUNKS OF OLD TREES.—There are to be found in most places, half-dead, gnarled trees, whose trunks and branches might be rendered

attractive by planting the undermentioned climbers at their base, and training their rambling shoots loosely over them, namely:—*Clematis Jackmanni*, *C. flammula*, *C. vitalba*, *Anemopsis hederacea* (Virginia Creeper), *A. Veitchii*, *Lonicera brachypoda*, and *L. sempervirens* (Evergreen Honeysuckles), *Wistaria sinensis*, *Passiflora corulea* (in southern counties), *Jasminum nudiflorum* (yellow), *J. officinale* (white), *J. revolutum* (yellow), *Vitis heterophylla*, and such Roses as *Banksiaeflora*, *Adelaide d'Oléans*, *Donna Maria*, *Félicité-Perpétue*, *Jules Margottin*, *General Jacqueminot*, *Achille Gouud*, and *Celine Forestier*. *H. W. Ward, Longford Castle, Salisbury.*

THE ORCHID HOUSES.

THE CATTLEYA HOUSE.—The earliest flowering plants of *C. Trianae* are pushing up their flowers in the sheaths, and care must be taken not to water over the plants, or the flowers will be spoiled by rotting inside the sheaths, or they will open imperfectly. Too much water at the root, or sharp variations of temperature, bring about the same evil result. It may happen that the sudden changes of the weather may deceive the man on duty, and the house get too warm or too cold; in these cases the man is little to blame.

What a change has come over Cattleya-houses at this season by the advent of the autumn-flowering species! A year or two ago, *C. labiata* was rarely seen in flower, and when it was, it was something to be noted; but now they seem to be coming into cultivation plentifully, and are more to be valued than *C. Mossia*, seeing that they bloom at a time when other Orchids are scarce. *Oncidium sarcodes* is a beautiful plant when in flower, and a comparatively good grower. Our plants are sending up their flower-spikes, and I would warn amateurs against leaving the spikes in their entirety. *O. sarcodes* usually has under cultivation a spike too large for the strength of the plant; if the whole of it remain, it will quickly debilitate the plant. The same thing occurs with some other *Oncids*, especially *O. crispum*, *Marshallianum*, *curtum*, and *varicosum*, almost the pick of the genus, and far better is it to have smaller flower-spikes and keep the plants strong and healthy, than allow them to get weak and dwindle away.

Oncidium cheiroporum, plants of which are now in flower, always are an attraction for those who like fragrant flowers. It was a favourite with the late Mr. Spyers when he was at Burford; and I remember with what pride he showed me the first really well-grown plant. It does best during the winter in the Cattleya-house, as the bulbs are liable to decay in a cool-house; but during the season of growth the plant is at home in the *Odontoglossum*-house, if stood close to the glass where the ventilation is good. *Oncidium macrothum* is on the whole the best *Oncidium* grown, succeeding in the coolest part of the cool Orchid-house, and possessing charming flowers. I have seen this plant growing grandly quite close to the door of an Orchid-house which was thrown wide open when the temperature outside was at freezing-point. All the *Oncids* grow well in a compost consisting of fibrous peat and sphagnum moss. The list of temperatures given in my last Calendar will still hold good. *A. G. Catt, Parkfield, Hallow.*

THE KITCHEN GARDEN.

CAULIFLOWERS IN FRAMES AND HANDLIGHTS should be exposed to the weather day and night, so long as there is no actual frost, the aim of the gardener being the securing sturdy plants fit to stand winter hardships. Sometimes it is advisable to pot-up plants from the beds of the latest-sown Cauliflowers, using 3-inch pots, and putting these into a cold frame without much ventilation till rooted, but afterwards treating them like the others. In early spring, before they become pot-bound, these potted plants may be repotted in a mixture of stiff loam and well-rotted manure in equal proportions, the potting being done firmly. Treated in this way, strong subjects for early planting may be obtained that may be trusted to bring good heads. Where only a few are required, this is a very good method of securing them for spring planting.

CABBAGES have made rapid growth, and any that may still remain in the seed-beds should be pricked out, the removal giving them a beneficial check, which tends to sturdiness. All land under Cabbage should be hoed in dry weather, and the plants gradually earthed-up, all withered leaves being removed, and powdered quick-lime and soot strewed over them if slugs are troublesome.

SALADS.—Lettuces and Endives in frames, in a fit state for use, will require much attention, and air should be afforded them on all mild days and nights, but exclude the rain, and keep the soil moderately dry. Cos Lettuce should be tied up one week or more before it is required for use; and Endive, to be thoroughly blanched, tender, and free from bitterness, should be tied up for a fortnight, but before it is covered or tied, the leaves should have got as dry as possible. Any frames which have been cleared may be refilled with plants from out-of-doors, or the thinnings from store-frames.

MUSTARD AND CRESS is best sown at this season in shallow boxes of light soil. Make the surface of the soil firm before sowing the seed, and keep it moist and shaded till germination takes place.

RADISHES.—Late-sown Radishes outside, and in cold frames, should still be available for salads; and for succession sow seed in a gentle hot-bed, covered with 6 to 8 inches in depth of light soil, and afford but little light and air till the first leaf appears.

CARROTS.—A hot-bed should be made up for an early supply of these, and it may consist of stable litter and tree leaves, which should have been prepared. [These hot-beds are best made in holes dug out in the ground, and not stood on the level of the ground to lose half their heat from thus exposing them. The hole should be large enough to admit of a lining being given when the heat declines. Meanwhile, any kind of litter may be packed round the bed to conserve its warmth. Eo.] When the 3-inch layer of sandy soil placed on the bed has become warm, the seeds may be sown in shallow drills 6 to 8 inches apart, and 2 or 3 inches apart in patches of 3 or 4 seeds, or broad-cast sowing may be adopted, Radish seeds being thinly sown after the Carrot drills, &c., are covered. The soil being moderately moist, little or no water will be required at the time of sowing. Cover the glass at night, and maintain a temperature at the top of 60°, and in the bed itself of 75° to 80°. *C. J. Waite, Glenhurst, Esher.*

FRUITS UNDER GLASS.

EARLY PEACH-HOUSES.—In a previous Calendar I advised the preparation of this house, but its starting will depend on the time when ripe fruit is required. If that be early in May, the trees in this house should now be moving gently with swelling buds, and a slight increase in warmth may safely be afforded on dull days, keeping it at 55°, and 10° more by sunheat; but at night it should not exceed 45° to 50°, and this is easily maintained by allowing a little extra warmth in the pipes during the day, with a small air inlet at the top of the house, and closing early and checking the heat by shutting the valves in the pipes; the warmth of the water will keep the house, by these means, sufficiently warm in mild weather. A dry heat in the Peach-houses is undesirable, and I, therefore, cannot advise the opening the ventilators for the sake of lowering the temperature of the house, but would rather keep them closed, and use less artificial heat. Employ the syringe freely, and do not omit to damp the floors and the stems in bright weather, even when the trees are in bloom. Always let the wood get dry by nightfall, and do not damp-down in the evening when the trees are in bloom; but during the day, when plenty of air can be given, there is no need to fear a too-humid atmosphere. The roots should be in a growing condition, indeed it is the best plan, when starting a Peach-house, to give the borders a thorough watering with tepid water, and once again before the flowers are fully expanded over all parts of the trees; this is the more necessary if doubt exists as to their state, or they are shallow. Shallow borders, or those made with very porous loams, should be well supplied with water at about 85°, as often as they appear to need it. If the interior border is covered with a layer of leaves, or leaves and stable dung, their warmth will excite growth, and at the same time avert the quick drying of the soil. When the flowers have opened, assist their fertilisation by brushing the pollen about with a feather brush, camel-hair pencil, or hare's tail—a very essential operation at this season.

A succession Peach-house should be started during the month at a temperature of 50° by day and 43° to 45° by night; it will depend on the kind of weather experienced whether fire heat be necessary or not at the start. The various directions given for the earliest house are equally proper for the next one started. Late Peaches will now be in good condition for pruning and cleaning, and to do this properly, the

trees should be unfastened from the trellis. If they are infested with scale in any degree, the old wood must be washed with warm water and soft soap, to be followed with a dressing of Gishurst's Compound Soap. Every part of the interior of the house should also be thoroughly cleaned, the Peach trees being bundled up, and fastened to stakes driven into the borders meanwhile. Limewash the walls before the trees are replaced on the trellis. Lay in the shoots thinly, or small fruit will result. Afford the trees all the light and air possible during mild weather, do not let the roots lack moisture, and generally proceed according to previous instructions. *G. Wythes, Syon House, Brentford.*

THE HARDY FRUIT GARDEN.

HORIZONTALLY - TRAINED AND CORDON PEARS.—These trees should be relieved each year of some of their long fruit-spurs, cutting these back to within half an inch of the base, from which point other fruit-buds will eventually develop. Prune to two buds all overright shoots, and shorten back the leaders to within 15 inches of the previous year's wood. Trees which are intended for training as espaliera or wall trees should have their leading stem shortened back to a point where the next pair of branches should spring, and by following this method of pruning the stem-leader each year the tree will be well furnished with fruitful branches. Where the saw is used in heavy pruning, the wounds made with it should have their edges pared smooth to facilitate the healing process. Of varieties to plant, Marie Louise, Doyenné du Comice, Pitmaston Duchess, Burré Superfin, Conseiller de la Cour, William's Bon Chrétien, Madame Treyve, Louise Bonne of Jersey, Fondante d'Automne, Winter Nelis, Josephine de Malines, Triomphe de Vienne, and Glou Morceau are all of first-rate quality, while Catillac is still hard to beat as a stewing Pear. When pruning, save good shoots for grafting purposes, but leaving them on the trees for the present. Take them in January and lay them in under a north wall till grafting time arrives.

THE WORK IN THE ORCHARD.—Now that the leaves are down, and the weather mild, the necessary pruning of the trees should be performed, and the soil over the roots top-dressed with manure and soil. Never let the orchard trees become thickets of barren shoots and branches, but strive to keep the crowns thin, and the interior accessible to direct sunlight, for with sunlight and the play of the air through the branches, the better will be the fruits. Do not, however, be too severe with the pruning if the trees have been previously much neglected, but afford them at first only a moderate amount of thinning; and when the trees, in a season or two, have been put in good order, a little timely pruning done yearly will keep them right.

Top-dressing should never be neglected if the trees have become barren, and in the case of large orchards under turf, there is no better way of doing this than by pasturing sheep or horned stock in them. Sewage and farmyard liquid, if applied in winter, will be found beneficial to orchard trees, on turf or under crop. Cow-manure and loam form a good top-dressing. Trees on Paradise stock should have a layer of loam and manure put over the roots. Do not use a spade in digging amongst these trees.

For the destruction of lichens and moss, thoroughly dust the trees with quicklime and soot, the main branches being first scraped with a bit of hoop-iron, and afterwards limewashed. Petroleum and soapy-water, kept well-stirred while using, will be found an excellent remedy for American blight, &c., and should be thrown on the trees with the syringe in mild weather. The proper proportion is 1 gill of petroleum to 1 gallon of water. Protect the stems of young trees against the ravages of rabbits by means of wire-netting, or a dressing of petroleum, soot, and clay, with enough water added to make it workable; two dressings during the winter, in most cases, will be sufficient. See that all the stakes are made good, and old pads and ties renewed. The current season's shoots on young trees may be pruned to 12 or 18 inches in length, always reserving the best placed of these to form the base of the future crown. *H. Markham, Mereworth Castle, Maidstone.*

PLANTS AND THEIR CULTURE.

HARD-WOODED PLANTS.—Boronias, Erioste-mons, Epacris, Correas, &c., will now require careful watering at the roots; and rather err on the dry side than afford them too much water, but avoid allowing them to become too dry. Always use soft or rain-

water, which is much the better for this class of plants. Give air on all favourable occasions, and let the night temperature be kept from 45° to 50°.

CHRYSANTHEMUMS.—Chrysanthemums will now be past their best, and steps should be taken to remove all unsightly plants. Plants which have been grown for specimen blooms are sending out a quantity of side-shoots, and these will be found most useful at a later date for furnishing cut flowers, if the plants are placed in a vinery or late Peach-house.

BOUVARDIAS.—Introduce the earliest plants of Bouvardia. These are invaluable at this season both for cutting and decorative purposes, and if grown in batches, they will afford a succession of blooms all through the winter.

PRIMULAS.—The double and single varieties of Primulas will also be doing good service now, and manure-water should be given the earliest-sown plants, which will strengthen the bloom.

HYBRID RHODODENDRONS.—These will now be found very useful, in providing a quantity of their bloom. Keep the plants in a warm greenhouse temperature, and any pruning or cutting-back which is required should be left over till the plants have done blooming.

SOLANUM CAPSICASTRUM.—Plants of these which have been grown on in pots during the summer will now be found very useful. Before bringing the plants in, see that they are thoroughly clear of green-fly, &c.

DAPHNE INDICA ALBA.—This is a very useful subject at this season of the year, and is a plant easily grown, if care is taken in not over-potting or giving it too much water at the roots. When making its growth give it a genial temperature, and any unduly strong growths should be pinched back, so as to form dwarf bushy plants. *R. Milner, Penrice Castle, Swansea.*

THE APIARY.

PACKING SECTIONS, ETC.—Unglazed sections that are intended to be despatched in quantity by rail, will require careful management in the matter of packing, or they are sure to get much damaged on transit, and cause dissatisfaction to the purchaser. It is important not to pack too many in one box, as a package containing a gross of sections is more likely to be subjected to rougher usage than one containing, say, half that number, or less, which can be more easily lifted. Hay is about the best and cleanest material to use for the packing, but the sections should first of all be tied up in brown paper in half-dozens, and they will then be in good order when taken out through not having been in contact with the hay. A handle on each side of the box should be provided to lift it by, and the nature of the contents plainly marked on the address label, or on the outside of the package, such as the words, "Honey in the comb. This side up, with care." Sections in half-dozens or dozens travel very well in boxes lined throughout with corrugated paper, only they must be packed so that they cannot move about. Messrs. Neighbour sell a wooden case which may be had in the fat, and folds up to take a single section. This answers well for sending through the post, and is inexpensive. Nothing is better for sending extracted honey away in bulk than the tins sold for the purpose by appliance dealers. They can be procured to hold almost any required weight, and are cheap. If bottles are required, they should be wrapped singly in paper, and then packed in hay or straw, taking care to have a thick layer at top and bottom; or they will travel well in the corrugated paper before mentioned.

MOVING HIVES.—Any changes that are desired to be made in the arrangement of the apiary may soon be taken in hand. Bees that have been confined to the hives by cold weather for two or three weeks can be moved safely, without any loss, but they should not be jarred or shaken in any way to cause disturbance. If they are to be moved any considerable distance, a sort of hand-barrow should be improvised so that two persons can carry them comfortably. In choosing a new location for an apiary, select a spot that is sheltered from north and easterly winds, if possible, and on low ground. Colonies placed under trees are warmer in winter than if out in the open, and an advantage is gained in summer from the shade, which counteracts swarming. A clear flight, however, must be provided for the bees in front of the hives, and plenty of head-room is required for the bee-keeper. *Exprt.*

EDITORIAL NOTICES.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages of gardens or of remarkable plants, flowers, trees &c., are solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, DEC. 8. { Royal Horticultural Society: Lecture on Hellebores; and all Committees meet.

WEDNESDAY, DEC. 9. { National Rose Society: Annual Meeting and Dinner.

SHOW.

WEDNESDAY, DEC. 9. { National Chrysanthemum Society (two days).

SALES.

MONDAY, DEC. 7. { Dutch Bulbs at Protheroe & Morris' Rooms
Dutch Bulbs at Stevens' Rooms.

TUESDAY, DEC. 8. { 12,000 *Lilium auratum* and other Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, DEC. 9. { Sale of Plants and Bulbs, &c., at Protheroe & Morris' Rooms.
Fruit trees at Stevens' Rooms.

THURSDAY, DEC. 10. { Important sale of Nursery Stock at Le's Nursery, Feltham, by Protheroe & Morris (two days).

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.

THE antagonism between the Garden Craft architect and the landscape gardener seems as if it would never cease. The designer of the mansion wants his way, the landscape gardener is no less tenacious in the advocacy of his rights. There result endless discussions as to the functions of art in the garden—whether there should be any art at all in the garden, or, seeing that in some shape or another it is inevitable, it should not be that art whose primary function it is to conceal itself. These and other cognate questions are raised in a recently-published volume,* the work of a distinguished architect who has lately passed away. Indeed the book is a posthumous publication, and in places shows the want of that revision to which it would probably have been subjected had the author lived. Thus within twenty pages he repeats the following passage from Addison:—“I think there are as many kinds of gardening as of poetry. Your makers of parterres and flower-gardens are epigrammatists and sonneteers in this art; contrivers of bowers and grottoes, treillages and cascades, are romance writers.” Thus in the following passage, wherein the author is alluding to terrace gardens he inveighs against a dogmatism from which he is himself not altogether free:—“If,” says Mr. SEDDING, “one is to promulgate opinions that shall run counter to the wisdom of the whole civilised world, it is, of course, well that they should be pronounced with the air of a Moses freshly come down from the Mount, with the tables of the law in his hands. . . . There is no code of taste resting on any solid foundation which proves that garden

or park should have any extensive stonework or geometrical arrangement. . . . Let us use as few oilcloth or carpet patterns and as little stonework as possible in our gardens.” Mr. SEDDING does not approve of that passage, and many people will be of the same opinion; but while he thus quizzes the dogmatic assertions of other people, he is by no means free from arrogant self-assertiveness himself. Thus he speaks of the present race of landscape gardeners, including, be it remembered, such an artist as MARNOCK: “Their intentions are admirable beyond telling, but their work exhibits in the grossest forms the very vices they condemn in the contrary school, for the expression of their ideas is self-conscious, strained and pointless.” And, again: “It is indeed wonderful to what heights the British fancy can rise when put to the push, if only it have a congenial field. So here we have flower-beds shaped as crescents and kidneys, beds like flying bats or bubbling tadpoles, commingled butterflies and leeches, stars and sausages, hearts and commas, monograms and maggots, a motley assortment to be sure—but the modern mind is motley, and the pretty flower-beds smile a sickly smile out of their comic beds as though Paradise itself could provide them with no fairer lodgings; and yet, if I dare speak my mind, ‘sike fancies weren foolerie,’ and it were hard to find a good word to say for them from any point of view whatever. Their wobbly shapes are not elegant; they have not the sanction of precedent, even of epochs the most barbarous; and, though they make pretence of being a species of Art, their mock formality has not that geometric precision which shall bind them to the formal lines of the house, or to the general bearings of the site. Not only do they contribute nothing to the artistic effect of the general design, but they even mar the appearance of the grass that accommodates them. Design they have, but not design of that quality which alone justifies its intrusion. No wonder ‘Nature abhors lines,’ if this base, a spurious imitation of the old formality that CHARLES LAMB gloats over, is all that the landscape-garden can offer in the way of idealisation.”

We have cited this passage, not only on account of its manifest truth from the author's standpoint, but also to show that he is every bit as dogmatic as the landscape gardener at whom he girds.

Beauty of fitness is, after all, the highest form of beauty, so that whilst the architect is fully justified in creating terraces, and the gardener in decorating them in a style that harmonises with and is the due complement with the style of the adjacent mansion, either of them would be deplorably in error if they designed a similar garden in the midst of the park. Something, too, must be allowed for individual taste. Mr. SEDDING's taste was clearly in the direction of artificiality in gardening. He expresses his admiration for that curious survival of Levens, Westmoreland, of which we give an illustration, fig. 97, p. 671.

It would be vandalism, indeed, to destroy so fine an example of a style no longer fashionable; but it would be grotesque folly to copy it in any modern garden. On one point we cannot agree in any degree with Mr. SEDDING, and that is in his appreciation of shrubs clipped and tortured into the semblance of birds or beasts, or any of the quaint conceits of the old practitioners of the topiary art; we cannot conceive that this practice is defensible on any score whatever—as well make a cannon of glass or a statue in soap as carve out of foliage forms utterly un-

suitable for the purpose. Contrast is allowable, and often agreeable in a garden, but deliberate incongruity is mere childishness.

Another point in which Mr. SEDDING, like most of his fellow architects, is deficient, is in his knowledge of and sympathy for plants. Architects too often look on plants as so many bricks, or, at best, as so many pieces of decoration, to be considered only from an ornamental point of view. Landscape gardeners themselves are too often imperfectly acquainted with the resources at their command, but, at least, they have far more sympathy with plants, creations instinct with life, responsive to every varying phase of soil or climate, of sun or shadow, possessed of a history full of interest for those who have eyes to see, full of promise for those whose imagination enables them to picture forth the future. But is there no common ground where the garden architects and the landscape gardeners may meet in unison? There is truth in the contentions of both parties. Is it not possible to let each have his way under appropriate circumstances, and where it is possible to secure a compromise in which the best features of either shall be combined for the common good? Undoubtedly it is; and the author whose book has suggested these remarks recognised this, and in his last chapter drops his invective against the modern landscape gardener, and allows us to put down his book with a genial glow of satisfaction, instead of a feeling of antagonism such as some other chapters are calculated to induce. “Here one may well leave the matter without further labouring, content to have proved by the example of a four square sane genius [WORDSWORTH], that those instincts of ours which seem to pull contrary ways—Art-wards or Nature-wards—and to drive our lop-sided selves to the falsehood of extremes are, after all, not incompatible. The field, the waste, the moor, the mountain, the trim garden with its parterres and terraces, are one Nature. These things breathe one breath, they sing one music, they share one heart between them; the difference between the dressed and the undressed is only superficial. The art of gardening is not intended to supersede Nature, but only to assist Nature in moving these affections of those who have the deepest perceptions of the beauties of Nature, who have the most valuable feelings . . . the most ennobling with Nature and human life.” And so we take leave of a book, the literary style of which renders it as pleasant as a flower garden of an amateur, whilst the substance is, in its way, as full of interest as the garden of the connoisseur. We need say nothing further to recommend it to the notice of our readers, who will find much amply worth their attention, but to which the limits of our space preclude more than the bare mention.

OUR ALMANAC.—Secretaries of Societies and others are earnestly requested to forward shortly, the dates of show fixtures, and meetings of horticultural societies of any kind for 1892, for insertion in the Almanac to be published in our issue for January 2.

ROYAL HORTICULTURAL SOCIETY.—On Tuesday, December 8, the above Society will hold, in the Drill Hall, James Street, Westminster, a show of Christmas Roses and other flowers, also fruits and vegetables. A lecture on Hellebores will be given at 3 P.M., by the Rev. Canon ELLACOMBE.

LINNEAN SOCIETY.—At a meeting held on November 19, Professor STEWART, President, in the chair, Mr. W. L. BROWN was admitted a fellow of the society. Mr. S. JENNINGS exhibited a collection of

* *Garden Craft, Old and New*, by the late JOHN D. SEDDING. Sixteen illustrations. RIGBY PAUL, TRENCH, TRUBNER & Co.

wild flowers made by him during a recent tour through the Rocky Mountains, California, and Mexico. Mr. E. F. COOPER exhibited specimens of a new variety of *Potamogeton* from Loughborough, lately described and figured by Mr. ALFRED FRYER (*Journ. Bot.*, Oct., 1891). Mr. A. W. BENNETT exhibited and made remarks upon some specimens of *Hydrodictyon utriculatum*, Roth. (*H. reticulatum*, De Toni), and some drawings of anomalous *Cypridium* and *Disa*. Mr. W. CARRUTHERS, F.R.S., gave a graphic account of a recent visit to Sweden in search of original portraits of LINNÆUS, and detailed the result of his enquiries. His remarks were illus-

trated by an exhibition of engravings and photographs. A paper was then read by Mr. THOMAS HICK "On a new Fossil plant from the lower Coal Measures." An interesting discussion followed, in which Mr. CARRUTHERS, Mr. G. MURRAY, Professor F. O. BOWER, Professor MARSHALL WARD, and others took part.

GARDENERS' ORPHAN FUND.—The committee met at the Horticultural Club, Hotel Windsor, on the 27th ult., WILLIAM MARSHALL, Esq., in the chair.

of the Fund, the committee came to the conclusion that they would be justified in placing at the next election an eleven additional children upon the Fund, bringing the number up to fifty, and the Secretary was instructed to issue the necessary notices to that effect. Already twelve applications on behalf of orphan children have been sent in to the committee. It was resolved that applications be sent in by December 15, and that the next annual meeting and election should take place on Tuesday, February 3, at the Cannon Street Hotel. The date of the annual dinner, at which Alderman Sir JAMES WHITEHEAD, Bart., is to preside, will be fixed later on.

FIG. 98.—VIEW IN MRS. GENERAL WILMOT'S GARDEN, ROSE BANK, MALVERN. (SEE P. 677.)

The Secretary, Mr. A. F. BARRON, read a list of special awards, as follows:—Mr. Matthew Todd, sale of fruit from his decorated dessert-table at the recent Edinburgh Chrysanthemum show, £2 7s.; Mr. W. Bates, Twickenham, collecting box at Twickenham Chrysanthemum Show, £1 5s.; Mr. William Bryant, Rugby, sale of flowers at Rugby Chrysanthemum Show, £6 4s.; Mr. W. H. Divers, the gardener, Ketton Hall, box at Chrysanthemum Show in the gardens, £1 12s 4d; Mr. F. Miller, North-down, Margate, collecting-box, 5s. 10d; and Woolton Gardeners' Society, £10 2s, per Mr. J. Rothwell, secretary, arising from the sale of flowers at the show, &c. On consideration of the financial position

NATIONAL ROSE SOCIETY.—The annual general meeting of the National Rose Society will be held, by kind permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Wednesday, December 9, at 3 P.M., to receive the report of the general committee; to

FRUIT AT WINTER AGRICULTURAL SHOWS.—The Monmouthshire County Council, with the view of promoting the better cultivation of hardy fruits, especially Apples, in the county of Monmouth, obtained permission from Lord TREDEGAR to arrange for an exhibit of Apples and Pears at his lordship's very popular and important agricultural show held at Newport last week, when Messrs. BUNYARD & Co., of Maidstone put up a very fine and interesting collection of Apples, and Mr. JOHN WATKINS, Pomona Farm, Withington, Hereford, staged a large and varied collection of both Apples and Pears; this latter collection contained a lot of really magnificent fruit, and attracted a good deal of

attention. Mr. W. J. GRANT, Principal of the Department of Agriculture and Horticulture, and Organising Secretary for the County Council, prepared a pamphlet containing, "Notes on Fruits for Monmouthshire," on the same lines as a pamphlet recently issued by the Royal Horticultural Society for the occasion, and which was distributed amongst agriculturists and others who visited the show, and proved to be an excellent means of diffusing information in a reliable and convenient form. We consider that much good might be accomplished by the addition of classes for English-grown Apples at such important agricultural gatherings as Lord TREDEGAR'S. At Birmingham, and the Smithfield Club at Birmingham, certainly, there were classes for Apples for the first time; but the terms of competition are prohibitive, and the provisions generally inadequate for such an important exhibition, which is visited by thousands of agriculturists, who hail from the length and breadth of the kingdom; while the fruit exhibition compares most unfavourably with that shown, not for competition, by Mr. JOHN WATKINS and the English Fruit and Rose Company, both of whom had stands of Apples, which were examined with much interest and advantage by many owners and occupiers of land, who never think of visiting a horticultural show, and who consequently have, comparatively speaking, little opportunity of seeing what can be done in the way of producing Apples, of the highest possible excellence, in our own country.

AMERICAN FLORA AT THE WORLD'S FAIR.—The native flora of each state and territory of America will be shown at the Exposition, Chicago, under the direction of Mr. J. THORPE, who has enlisted the lady managers to undertake the collection of specimens.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—A meeting of this society, as we learn from the *Newcastle Daily Chronicle*, Saturday, November 21, was held at the Literary and Philo-sophical Institute, Newcastle, last evening, Mr. B. COWAN in the chair. In the absence of Mr. ELLIOTT, who was to have read a paper on "Plant Construction," Mr. J. HOOD, jun., read a paper on "Chrysanthemums." A discussion followed, in which Messrs. W. R. ARMSTRONG, LARKE, MURRAY, the chairman, and others took part.

WILD PLANTS.—The native flora of Belgium, as of Britain, is almost or quite worked out, so far as the identification of species is concerned. The botanists propose to devote themselves next to the habits of plants, that is to say, with the life-history of each species, the relation between it and its surroundings, its struggles with competing rivals and with animal foes, and their relationship to other plants. This line of study has been proposed by the President of the Société Royale de Botanique de Belgique, Professor A. GRAVIS.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—On the 23rd ult., Mr. R. DEAN, Ealing, read at the usual fortnightly meeting of the above, a paper on "Aromatic Garden Herbs—their History, Uses, and Culture." The subject was treated in a popular manner, and it was generally felt that the herb garden is a department of the kitchen garden not now so much appreciated by gardeners generally as was formerly the case.

MUSHROOMS AT THE CHICAGO EXHIBITION.—The Agricultural Department of the Government will make an exhibit of facsimile casts of all of the 200 varieties of edible Mushrooms which grow in the U.S.A., at the Chicago Exhibition. It is believed that the exhibit will be productive of great benefit in educating the people respecting this valuable article of food, which is abundant, but now little utilised.

POPULAR NAMES. M. L. FERRERA, Professor of Botany at the Brussels University, in a letter

inserted in the *Bulletin de la Société Royale de Botanique de Belgique*, strongly recommends botanists to call plants by their Latin names, which are understood by the savants of the whole world. This plan should be adopted by both horticultural and botanical writers, who would thereby render their contributions intelligible to almost all readers, and immediately available for scientific purposes.

"**THE FRUIT-GROWER'S GUIDE.**"—Under this title a work is projected to be written by Mr. JOHN WRIGHT, F.R.H.S., and illustrated with coloured illustrations, by Miss MAY RIVERS. *The Fruit-Grower's Guide* will be serviceable to all persons who have an interest in the production of fruit, and to all growers of fruit either for home use or commercial purposes. The work will be embellished with forty-three coloured plates and three vignettes, in which upwards of one hundred of the choicest and most useful varieties of fruit of various kinds will be faithfully and artistically portrayed by Miss MAY RIVERS. The work will further contain about two hundred diagram illustrations by Mr. WORTHINGTON G. SMITH and Mr. GEORGE SHAYLER, representing: (a) The structure of roots, leaves, flowers, and fruit; (b) The draining of land and formation of borders; (c) Plans of fruit gardens and orchards; (d) methods of raising trees by cuttings, layers, budding, and grafting; (e) planting, protecting, and supporting trees; (f) pruning, summer and winter, root and branch; (g) training and shaping trees; (h) plans of various glass structures, showing approved methods of heating and ventilation; (i) fruit rooms and stores; (j) thinning, preserving, and packing fruit; (k) the insect and fungoid enemies of trees and fruit; and all other essential details for enabling the important subject of fruit culture and distribution to be understood even by the inexperienced. Particulars will be given on the soil—its preparation and improvement; manures—their uses and application, including surface dressings, liquid manure, and mulching; climatic conditions in respect to frost, dew, light, temperatures, ventilating, syringing, &c.; sites and shelter for gardens and orchards, with instructions for their formation; also the renovation of old gardens and orchards; descriptive particulars of planting, shaping, and training from the maiden to the fruiting tree; protecting buds, blossom, and fruit, also its thinning, gathering, and storing; selections of fruits for various soils and districts, with the forcing of all kinds of fruit, so as to maintain an unbroken succession for home use, or for meeting the ever-growing demands of the great centres of population. The work will be completed in twenty-two and a half parts, 4to, at 2s. each, or in six divisions, cloth, gilt edges, at 10s. 6d. each, or in three volumes, at 21s. each. Each part will contain forty-eight pages of letterpress and two coloured illustrations. Each 10s. 6d. division, one hundred and seventy-six pages and eight coloured illustrations. Each volume, three hundred and sixty pages and fifteen coloured illustrations. The issue is confined to subscribers, and supplied by J. S. VIRTUE & Co., Limited, Publishers, 294, City Road, London.

CORK PINE AT CHICAGO.—HUGH PRICE, one of the Wisconsin Commissioners, has made arrangements for securing for the World's Fair, at Chicago, a mammoth Cork Pine (*Squoa*?), a tree which is growing rare in his State. It is 24 feet in length, and will scale 2500 feet. One plank is 16 feet long, 3 inches thick, and 11 inches wide, without a knot or blemish.

SALT BLAST.—The gale which brought about the stranding of the *Terrene* at Sandgate, and the ultimate rescue of the crew, after many hours of suspense, must be still familiar to the reader. It is curious to observe the different effects of the gale on the various shrubs exposed to its influence. At Folkestone, for instance, the Japanese *Euonymus*, as a rule, subject to some exceptions, is unhurt; but Laurestine, standing in immediate proximity, has been well nigh killed. Aucubas look as if they had

been boiled, Hydrangeas are in not much better plight, Evergreen Oaks and Tamarisks look miserable on the exposed side, Privets are stripped of their leaves, Clematis and Brambles are in the same case, and even the tips of the leaves of *Iris foetidissima* look as if burnt. Austrian Pines have withstood the blast with a little browning of the foliage, or with no injury at all; the Pinaster, on the other hand, has suffered considerably. *Pittosporum Tobira* and *Eucalyptus globulus*, which survived for several years in the locality, succumbed to the frost of last winter.

"**THE AGRICULTURAL REVOLUTION.**"—Under this title, M. EMILE GAUTHIER, of the *Figaro*, has published for popular use a history of M. GEORGES VILLE'S experiments on the manuring of plants, accompanied by illustrations which are much more telling than columns of figures. M. VILLE, as is well known, is the earnest advocate for the use, in proper proportion, of chemical manures, appropriate to the particular crop. In principle, M. VILLE has proved his point; it is only on matters of detail that any difference of opinion is likely to occur—such, for instance, as the cost of the manures, and the use of farmyard manure, either alone, or with some fertiliser mixed with it.

CASUARINAS.—A few of these elegant Australian shrubs are grown in our conservatories, and some even form part of the repertory of the table-decorator. Their chief interest, however, is botanical. M. TREUB, the eminent director of the Botanic Garden at Buitenzorg, shows that the pollen-tube, instead of entering the nucellus through the micropyle, as is customary, makes its way through the chutaza. On this account Dr. TREUB has divided flowering plants into two divisions, viz., Porogams, including the Monocots and Dicots, and Chalazogams, comprising the Casuarinas only. The pollen-tube in some cases branches at the end, and the whole course of development of the female flower is different from that of ordinary flowering plants.

"**MONATSSCHRIFT FÜR KAKTEENKUNDE.**"—Dr. PAUL ARENDT is publishing in Berlin a monthly journal relating to Cacti, which may be had from BODO GRUNDMANN, Berlin, W. 57, or from WILLIAMS & NORGATE, Henrietta Street, Covent Garden. It is illustrated with reproductions by photography. Not only the botany of the order is attended to, but also the cultivation. We hardly think a monthly journal devoted to Cacti would pay on this side of the German Ocean; but it is worth consideration whether we may not look on recent publications in Germany and the United States as pioneers of a turn in the wheel of fashion.

GLASGOW BOTANIC GARDEN.—We are glad to learn that this fine establishment is now under the control of the Corporation of Glasgow, and that the Curator, Mr. BULLEN, is commencing with vigour the work of renovation which the long-continued period of difficulties has rendered necessary. We congratulate the residents of Glasgow on the termination of the misfortunes of their garden, and on the prospects of its success in the future under the guidance of so capable an administrator as Mr. BULLEN.

CABBAGE-CATERPILLARS.—In the treatment of Cabbage-caterpillars, says Mr. FLEISCHER, in his address to the Association of Economic Entomologists, Pyrethrum (Dust-powder), mixed with four times its weight of common flour, and then kept tightly closed for twenty-four hours, leaves nothing to be desired, and thousands of dollars are yearly saved to small growers, who most need the assistance.

GERMAN CUSTOMS DUTIES.—A collection of butterflies, destined for a German entomologist, was charged with duty on the ground that, as the insects had wings, they must be classed as poultry, and pay the same duty.

CHISWICK.—The new span-roofed plant house in the Royal Horticultural Society's gardens at Chiswick is now finished, and is worth inspecting. It was

built by Messrs. J. WEEKS & Co., of Chelsea, to whom the Council of the Society have accorded a special vote of thanks for "economy and excellence."

M. CRÉPIN.—The celebrations in honour of M. CRÉPIN, the Director of the Brussels Botanic Garden, to which we have already referred, will culminate on the 6th inst. with a banquet, at which the Minister of Agriculture and Public Works will be present.

M. AUGUSTE FRANÇOIS HARDY.—We greatly regret to hear of the decease of this gentleman on the 24th ult. M. HARDY was not only an active member of the governing body of the National Horticultural Society of France, but he was director of the National School of Horticulture of Versailles, an institution which he raised to a high state of efficiency. A portrait of M. HARDY was given recently in our columns.

NATURAL HISTORY SOCIETY OF ABERDEEN.—The first meeting for the winter session, of the above society took place at the Marischal College, Aberdeen, on Wednesday, November 25. The principal feature of the evening was the reading of a paper on "The Influence of Horticulture on the Taste and Manners of the People," by Mr. HARPER, head gardener, Duthie Public Park, Aberdeen. The essay was of an instructive and interesting character, and, during the course of his remarks, Mr. HARPER maintained that gardens and gardening were decidedly conducive to the welfare of the public generally.

ROSE BANK, MALVERN.

At a considerable elevation, and on the south-east of the Malvern Hills, stands this charming residence of Mrs. General Wilmot, well-sheltered by belts of evergreens and trees, planted so as to allow of views being obtained at various points of the lovely country around, and the more distant landscape. It is, however, the gorgeous summer bedding of the place which claims attention on this occasion, for nowhere else have I ever seen the tuberous-rooted Begonias employed in such profusion, or more floriferous or luxuriant as at Rose Bank. Begonias of every shade and colour abound everywhere—the perfection of all summer bedding plants. Whether it be the character of the soil in which they grow, which is the detritus of mountain limestone, or whether the salubrity of the surroundings cause them to flourish, I do not opine; and undoubtedly the gardener, Mr. Mason, gives them his especial attention. At this elevation the plants last in good flowering condition much longer than in gardens at a lower level. Mr. Mason was one of the first to take the tuberous Begonia in hand for massing, and he also has been very successful in raising a very distinct strain of erect-flowering varieties, pure selfs, of various colours,

and of regular and dwarf habit, well adapted for bedding purposes.

The flower gardens are laid out in a series of long and broad terraces of turf, with appropriately designed beds, arranged with skill. Each terrace is connected by means of sloping walks of easy gradients, well-concealed and arranged.

At the end of the principal terrace (see fig. 28, p. 675), flanked by tall evergreens, is situated a gallery, consisting of several tiers, each about 40 feet in breadth, which in the season is filled with several hundred plants of *Pelargonium Bonfire*, that flowered splendidly. Such a large mass of scarlet colour, with its setting of greenery, in the form of shrubs and trees and turf, is dazzling in the extreme, and in such a situation the brilliancy is not inharmonious.

To describe these terrace-gardens in detail would occupy much space. There are some beds of Begonias, self-coloured, canary-yellow, bronze, and orange-scarlet, which never fail to arrest the eye of the beholder on glancing over these pleasing combinations of colour. Some borders, designed to look like a chain, and the design filled in with Begonias, edged with Golden Feather, were very effective on a sloping parterre, as seen from the windows of the house.

Magnolia, Ceanothus, Fuchsia, and other half-hardy subjects flourish at this altitude, and their presence add greatly to the interest of the garden, the general keeping of which reflects great credit on Mrs. Wilmot's head gardener.

The saving of seeds from Begonia flowers, which have been selected for some especial feature, and artificially fertilised, is carried on year by year, and thus Mr. Mason is enabled to weed out the inferior varieties. In confirmation of this fact, I was shown a batch of seedlings possessing great vigour, and which were of exceptional merit, affording a great contrast to some other Begonia seedlings alongside, which were the produce of seeds obtained from abroad. W. C.

THE ROCK GARDEN.

I MUST beg to be permitted to say a few words in answer to the remarks of "W. A. C." in your impression of November 14. I notice at once that there is strong internal evidence to show reason why he is so partial to rockeries, and that he looks at them through coloured spectacles of his own; but let that pass—I will meet what he says word by word, and I traverse the whole of it. I suppose that the deepest sin which I commit in his eyes is that, as he thinks, I coddle my plants, and this is the worst he can say of me. But is it quite so certain, as "W. A. C." takes it to be? Has he ever given himself the trouble to consider for five minutes what coddling really is? The word can be used in a good sense, and it can be used in a bad one. According to one usage, it stands for little more than an affectionate regard, and then I plead guilty to the charge of coddling at once. "W. A. C." goes in for being natural beyond everything else; but does Nature never coddle her favourites? Ask the little *Gentianella*, which sleeps so tranquilly beneath the superincumbent snow, if it is not so? Little heeds it of the elemental strife which rages over its head, or of the devastating *bise* which could very soon have destroyed all the vitality it possesses. Enquire what the Violet says, as it lies buried in the forest under ten thousand leaves, and remains warm and snugly covered up when all around is icebound and stiffened with the cold. Look at that little point we call a bud, as it is wrapped around with fold upon fold by the deffest tenderest fingers, and is then, as in the case of the Horse Chestnut, varnished over so as to be impervious to wet. Admire the chrysalis as it lies in its silken shroud, and then let "W. A. C." say—if he can—that Nature avoids coddling, and is not greatly inclined to it. Why his very eyelash coddles his eye, and is a protector which softens and mitigates the too great glare of light—his moustache

and his beard, in all probability, coddle his mouth and throat, and keep in order those delicately-woven tubes, which are so sensitive to cold. The truth is, there is coddling in this sense everywhere all around, and safeguards, and protections, and mitigations are supplied by a loving hand in the most prodigal manner.

But I know quite well, "W. A. C." will say that all this is sheer nonsense, and not at all what he meant. He referred—of course he did—only to practices which have a very effeminate look about them (that is the word he would use), they are the outcome of folly—the evidences of a third-rate mind which has been at work—they are unnecessary and irritating to any person with common sense. Now let me ask "W. A. C." to look at this matter rather closely with me—it affects every gardener and garden in the kingdom—let us grapple with it if we can. I will give him three notes or marks of what coddling in a bad sense really is; if he can prove them against me he upsets everything I have done—if he fails in this, then his strictures on my alpinery come to nothing. The first note or mark which I offer is, that the efforts which are put forth should be largely in excess of what the requirements call for; the next is, that there should be a mis-direction in the aim; and the last is, that failure should ensue.

You would hardly blame a man who is engaged in a difficult enterprise if he takes rather too much care about it, provided only that he comes out successfully at the end. At any rate, it would not be called coddling in a bad sense, the result would plead in extenuation of his zeal; neither, on the other hand, could you label anything in a failure as coddling if you see no signs about it of over-much trouble. There would be misadventure or disappointment there. But given only fussy, irritating care, ill-judged effort, and disaster coming with a certainty on its heels, and I should contend with no one who says away with coddling when it only comes to this—let us all breathe freely again.

Now, I will give "W. A. C." an instance of what I believe coddling in a wrong sense really to be, and I will also give him an instance of what I am sure it is not, if only a right view be taken of the affair. The other day, one of my little girls dug up a Rose-bush from her garden, put it into a pot, located it in the hottest part of my greenhouse, hugged it (I saw it in her arms), very likely kissed it—though I am not so sure about that—watered it over-much, and nearly did it to death by her unremitting care. The Rose-bush was as nearly as possible sacrificed to her love. Now, I call that a typical instance of real genuine coddling in a bad sense, about which there can be no doubt at all. The zeal was excessive, the measures taken were wrong, and the result was deplorable. But I defy "W. A. C." or anyone else to say that there was coddling in a bad sense in what follows, and this will have the strongest bearing on the treatment of my alpine plants.

At the beginning of the year our well-known Snowdrop specialist, Mr. Allen, was in great difficulty about his splendid collection of Snowdrops—some Somersetshire trouble was afflicting them in a very sad manner. Snowdrop fungus had appeared to a great extent, and he did me the honour of asking me if I would take them under my wing, and do the best I could with them. At any rate, I had a large part of these Snowdrops to look after, and Mr. Boyd, of Melrose, had the remainder.

Very little time was given me to think about it, and, though I always should be glad to do anything in the world for Mr. Allen, I inwardly quaked very much at the thought of having such a very precious possession under my charge, and in such a shaky condition. So strongly had the Snowdrop fungus got hold of them, that Mr. Allen advised me not to take the bulbs into my garden near the house, lest others should be infected by them, but to grow them in a kitchen garden, which he knew I had a short way off. This, however, I would not think of for a moment. I determined to treat them under my own eyes, and to do what I could for them. No one can do any more than his best; and now what is the

result of all this on November 16, 1891? At least two thirds of these Snowdrops are above ground already. They are as strong and healthy as could be, and, as it is so very early in the season for Snowdrops to appear, I believe all the rest will follow suit, and this fine collection will be saved. I have not told Mr. Allen yet anything about it, and if he reads these lines when he is cracking his egg at breakfast—and the *Gardeners' Chronicle* comes into his hands on Saturday morning—he may take my word for it that his favourites are all right, and he may have a happy surprise.

But how were they saved? The answer is by what "W. A. C." calls coddling, and I should not call coddling at all; at any rate, not in a bad sense, or one to be deprecated in the least. I am certain that if "W. A. C." had walked round my garden any time during the summer months, and had come to that Snowdrop bed, he would have said to himself, or perhaps openly, "Coddling, coddling, it is all coddling in this garden, from the beginning to the end." Let it be so if he thinks it is, but if the means taken were in the right direction, as they manifestly were—if they were not overdone—and if the result is right it matters not to me what names are used—I shall coddle as long as I live. And this relates in the most direct manner to my rockery, or alpiery as perhaps it is called. What are my bits of glass and precautions against the sun, and woven or wooden screens, &c., but expedients which do their work, as the eyelash does for the eye? How are the means unfitted to the end? It is about as wise to leave some plants undefended to stand the rigours of an English winter, or, still worse, sometimes in the Isle of Wight the severity of an English summer, as it would be for one's self to go with linen breeches to the North Pole, or to stand on the Equator under a midday sun without any thatch on your head. Common prudence dictates some ordinary precaution, and in many cases they are as useful for plants as for men.

I entirely deny that "W. A. C." has given such a wonderful list of survivals as to prove that a happy-go-lucky way is the best. *Lithospermum prostratum* and *L. Gastoni* are both very hardy indeed, and there is no need to do anything for them; I never put them in the alpiery at all. *Hypericum reptans* gives no trouble, and though I cannot say I possess the three or four things which "W. A. C." has lately purchased from Messrs. Backhouse, I have their congeners, and I get on very easily with them. *Saponaria ocymoides* is also not difficult at all. Let "W. A. C." try *Pulmonaria daburica*, *Lewisia rediviva*, *Primula suffrutescens*, or *Edraianthus serpyllifolius*; or let him put in an *Opuntia* or two—or *Myosotidum nobile*, and many other things that might be named, and I will give up if his free-and-easy method carries with it any success in a marked and definite degree.

There are just two or three other points in his letter which I should like to notice, if you will give me leave to do so. When he writes, "If 'H. E.' goes in for quantity, he had better grow his plants in pots, and elevate them in accordance with his views," I can only say I do not know what he means, it is an unintelligible sentence to me. But when he goes on to say, that my "pockets are not large enough to admit soil to keep the plants alive," I join issue with him at once, and I declare it is not so; and besides this, I suspect there is more reason for what I do on this head than perhaps he has dreamt of. Of course, we all know that many alpine plants have very long roots, and they run back a great distance into the earth, but all this is fully provided for, and there is not, I am sure, a single instance of a plant suffering on my alpiery in the way that "W. A. C." has supposed. I wish, however to catechise my questioner about the point he has raised.

Does he know that too much soil is absolutely prejudicial to a great many alpine plants? I admit that it is a very difficult thing indeed to apportion the right amount, but a caveat should frequently be entered against supplying them with too much quite as carefully as it should be entered against

supplying them with too little. This applies in a very marked degree to the genus *Primulaceæ*. Herr Max Kolb gives as one of the reasons why they often blossom so scantily in our hands, that they have been fed too much. His words are these on p. 230 of his work on alpine plants, after loud lamentations over the disappointments he has met with: "But one has to blame oneself, they have been put into too big beds, or they have had too much nourishment," and he insists on this over and over again. On p. 234 he writes about *Primula calycina*: "It likes very little nourishment." On p. 237 he says that "*P. commutata* is apt to die off if it has too great nourishment." Little nourishment he prescribes on p. 240 for *P. Facchini*. "*P. hirsuta* is to be put into small clefts or holes," and so on in many other instances. He seems to think that there is quite as much danger of overdoing as there is of underdoing this business, and he warns his readers with emphasis against a common mistake which he frequently meets with. The truth is, according to him, that you might as well give a man a tremendous dinner and then ask him to sing a song, as supply some *Primulas* with too much nourishment and then expect them to blossom. I very much fear that if he saw some of the Monte Rosas and Matterhorns of modern days, and the *Primulas* that often look so unhappily upon them, he would use the words of commiseration which he has given us in his book, and his verdict about the disappointment of their constructor would run in precisely the same groove as that with which we are already familiar—"It is his own fault—there is too much earth." He might add to it this: "He has coddled in a bad way after all." Also, he is quite wrong in asserting that a plant cannot develop in a pocket, be it large or small. It does develop, and runs over the sides with the greatest possible ease. Also, it is a mere travesty to assert that ladies must ascend a ladder to look at the plants. It is no such thing at all. The alpiery is commanded by the eye in every part with the greatest facility. A small ladder, as I have said, is of use for the gardener to work on when he looks after the two highest tiers; but this would have been saved if I could have found space to make my construction wider.

A much wiser man than "W. A. C." appears to me to be, was visiting my garden the other day—he is an F.R.S., a professor of botany, &c.; and when he saw how well the things were doing, and took occasion especially to note the "hideous slabs," he gave it as a possible explanation of the general well-being he beheld, that heat is given off in the night from these limestone slabs, and that thus the temperature of day and night is equalised in a very marked degree, which alpine plants love so much. If opinion is to be set against opinion, I think at present, that those who know the most about plants have the most declared themselves in favour of my plan; and here, therefore, so far as I go, the matter may rest. I am accustomed to the tombstone jokes, and the allusion to a cemetery; they are stale and worn out, but if it pleases any one to renew them, let him renew them. For me, it is enough to know that life, not death, presides over my little spot. *Hic floret* instead of *hic jacet* runs on the tombstones as a rule, and strange to say, as surely as the spring comes round, there is a grand annual resurrection, and thousands of little lives are renewed. On terms of this sort, I am willing to be called the keeper of a cemetery, if "W. A. C." desires to have it so—it matters little to me. *Henry Ewbank.*

SCOTLAND.

SCOTTISH HORTICULTURAL ASSOCIATION'S CHRYSANTHEMUM SHOW.

This show was opened in the Waverley Market, Edinburgh, on Thursday, November 19. Last year the number of competitors was 151; this year there were 157. Last year there were 792 entries; this year

they number 871. The advance which is apparent from those figures was also maintained in the leading exhibits, which were, in quality, in advance of any that have yet been shown.

The great feature of the show was, of course, the exhibition of *Chrysanthemums*. It is probable that there were on view not far short of 200 varieties of *Chrysanthemum*, every one of which presented some special feature of form or colour, and ranged through all the shades of yellow and bronze, and brown and pink, and purple to purest white, and blooms of hardest form to those of filmiest petal. The great prize of the show, for which there were about a dozen competitors, is the City of Edinburgh Cup, valued at £20, offered for the best forty-eight blooms, Japanese *Chrysanthemums*, of not less than thirty-six varieties. This was secured by Mr. J. W. M'Hattie, of Newbattle Abbey Gardens. His blooms were all well grown, and shown in perfect condition, some of them measuring as much as 6 inches across; they included most of the well-known varieties. The 2nd prize lot, which was exhibited by Mr. Parker, Imprey, Droitwich, also contained some very choice blooms, but they lacked the evenness of quality of Mr. M'Hattie's.

The next most coveted honour at the show was the Scottish Challenge Cup, presented by the Association for the best twenty-four blooms of incurved *Chrysanthemums*, and open to Scottish gardeners and amateurs only. It was won by Mr. Alexander Watt, Blackhouse, Skelmorlie, with an exhibit of very even merit.

In the competition for the best twenty-four *Chrysanthemums*, Japanese and incurved, Mr. Richard Parker showed some blooms which were hardly surpassed in the show for delicacy of colour and excellent condition.

The smaller competitions all brought out their quota of splendid specimens, and the exhibition of single varieties constituted a feature in their corner of the market.

The Government of Nova Scotia, through Dr. George Lawson, Secretary for Agriculture to the colony, sent a collection of about eighty varieties of Apples, all fine samples of their kind; large, full, and richly coloured. It comprised most of the fine varieties for the production of which the colony is famed, notable amongst them being splendid samples of *Blenheim Pippin*, *Ribston Pippin*, *Gravenstein*, *King of the Pippins*, *Golden Pippin*, *Ohio Nonpareil*, *Seek-no-Further*, *Grimes' Golden*, *Cabasba*, *King of Tompkins County*, *Ben Davis*, *Fallwater*, *Baldwin*, *Vandevere*, and many others which have appeared in former collections exhibited from Nova Scotia. Among those not previously seen at Edinburgh, *Red Jewel* bears a considerable resemblance to a large and well-grown *Cox's Orange Pippin*; *Eton Spy*, an improved *Northern Spy*; *Haas*, a very handsome, roundish, bright red Apple; and *Nod-head*, a large, round, green, red-cheeked, useful-looking fruit. *Wellington* was also in the collection for the first time, but although full-sized and clean grown, it was less-briskly flavoured than home-grown samples, a drawback peculiar to most, if not, all culinary Apples grown in America. Dr. Lawson also sent a whole barrel of splendid *Gravenstein* Apples, to show the method of packing for exportation, which was a point of much interest to the growers of fruit; but with the general crowd the beautiful, rich, juicy Apples proved more attractive than the method of packing, and it was impossible to keep the barrel intact to the end of the show. The collection received a well-merited award of a Special Gold Medal.

The same award, a Special Gold Medal, was made to Messrs. Dicksons & Co., nurserymen, Edinburgh, for a grand collection of upwards of 150 varieties of Apples and Pears, the enumeration of which would include all the popular varieties of the day. Among them *Mère de Méauge* and *Peasgood's Nonsuch* Apples were conspicuous from their great size and fine colour; and among Pears *Calabasse Grosse* was the weightiest, although many other better varieties followed closely. Fine samples were exhibited of

THE CONFERENCE PEAR (RIVERS).

the two new Apples, James Grieve and Bailie Neilson, for the latter of which they received a First-class Certificate, the former being previously certificated. Both are handsome fruit, and useful types of Apples, of which more will be heard in future, when they become better known.

Mr. William Ingram sent a very interesting collection of thirteen varieties of Pears from the gardens at Belvoir Castle, Leicestershire, which were very highly commended by the judges for their fine size and excellent qualities. Besides grand samples of such well-known varieties as Doyenné du Comice, Beurré Superfin, Easter Beurré, Winter Nelis, Josephine de Malines, Glou Morceau, and Beurré Rance, the collection included Louise Cappe, Beurré du Bouisson, Conseiller de la Cour, Huyshe's Bergamot,

This variety of Pear is a seedling raised by Mr. Rivers, of Sawbridgeworth, and submitted to the committee of the National Pear Conference in 1885, the name of Conference being given to it as a memorial of the gathering, it being the only English seedling Pear certificated there. Fruit, large and pyriform; skin, bright yellow, for about one inch below the stalk, beyond which it is yellow covered with bright russet; stalk, 1 inch long, inserted without depression; eye, open; sepals, erect, placed in a shallow basin; flesh, salmon-coloured, by which the Pear may be readily distinguished; rich, melting, very juicy, and buttery.

FIG. 99.—THE CONFERENCE PEAR.

extra fine; Marie Louise d'Uccle, and Prince Consort, the last a very fine sample.

For a table of home and foreign fruit, Mr. More, fruiterer, Queen Street, Edinburgh, was the only competitor, and deservedly secured the Association's Gold Medal for an excellent display of a great variety of fruits.

Great regret was felt that the exhibit of fruit from the United States Government did not reach Edinburgh before the show was closed, owing to stress of weather in the Atlantic; but the Association was to exhibit it at the first monthly meeting on Tuesday, December 1.

The display of vegetables was, as is usual at Edinburgh winter shows, large in numbers, and of high excellence all round.

This is a dessert Pear of first-rate quality, equally vigorous on the Pear and Quince stocks; on the Pear stock it begins to bear fruit three years from the graft, and is therefore well adapted for orchard and garden culture. It is a vigorous grower, and an abundant and regular bearer, and likely to take rank as a standard Pear in England. It is rather singular that a Pear of this quality should have been raised from a baking Pear. The drawing from which our figure was taken was by Miss Rivers.

HOME CORRESPONDENCE.

CLIMBING NIPHETOS ROSE—I have read with some interest the several notes that have appeared in recent numbers of the *Gardeners' Chronicle* anent

the above Rose. Without wishing to enter into a discussion, or to differ from any views already expressed, I beg to state that the plant as seen at Messrs. Keynes, Williams & Co.'s nurseries, is both climbing and free-flowering. On passing through the houses of the above firm some two or three years ago, I noticed that one of the Roses had made within four months 22 feet of growth. Although this shoot was the longest, there were many others nearly as long. With regard to the flowering propensity of this Rose, some difference of opinion at one time existed, but as seen in the above nurseries, it is positively free-flowering. I happened to call at the nurseries in the spring of the following year, in which reference is made to the 22 feet growth, and on that very plant I counted nearly one hundred flowers then in a bud state fit to cut, without noticing any that were small, or referring to those that had been cut. More recently, I have seen instances of this Rose rambling in the freest manner over the roofs of houses, and also observed the same plants blooming equally free. *C. Warden, Clarendon Park, Wilts.*

CEDRUS DEODARA FRUITING.—There seems to be much interest manifested this year with regard to the fruiting of the *Cedrus Deodara*, strengthened, no doubt, by the very excellent figure given of it in your issue of October 10, p. 423, and referred to again by a correspondent the next week. One is almost tempted to ask if it is a very unusual thing for the Deodar to fruit in this country, it so, it may be of interest to mention the following. I have in the gardens here, amongst others, a young tree of *Cedrus Deodara*, 20 feet in height, which has borne female cones every year for five years in succession, and has at the present time about forty very fine cones upon it. I have raised some young plants from it twice, thus proving that some, at least, of the seed was capable of vegetating. The tree is in good health, and grows in a very light soil, consisting chiefly of leaf-mould, with a great number of stones in it. *T. Sharman, Rozel Bay, Jersey.*

— From amongst a collection of some forty trees of *Cedrus Deodara*, planted about twenty-eight years ago at this place, we have one tree which has seven cones, quite as good as the Dropmore tree, figured in the *Gardeners' Chronicle* on October 10. In the last week in the month of October the scales of these cones began to open from the base upwards to about three-fourths of their height, and remained open for about ten days, when they closed up tightly as before, and have so remained ever since. Is this a usual thing for them to do? *J. Willis, Bishopsteignton, Trignmouth.*

BOCCONIA CORDATA.—Having observed some remarks in the last issue of the *Gardeners' Chronicle* respecting *Bocconia cordata*, I should like to say that there are two plants in the gardens at Shopwyke House, and one of them in an exposed bed of herbaceous plants; the other in the foreground of a belt of shrubs, and neither have had any protection in winter. Both made stems this last season between 3 and 4 feet high. This is the first place in which I have met with the plant, but I fully agree with Mr. Earley's remarks, that it is a grand solitary plant on the lawn, where we intend to have one next year. *A. Godden, Shopwyke House, Chichester.*

PITMASTON DUCHESS PEAR.—Your correspondent asks if his Pears (Pitmaston Duchess) are not unusually large. I exhibited eight fruits of this variety at the Bath Chrysanthemum Show on November 11, which weighed 10½ lb., the largest weighing 26 oz. The tree, which is ten years grafted, brought to maturity four dozen fruits, and but half-a-dozen of them were less than 1 lb. apiece. *J. Gibson, Draycot Gardens, Chippenham.*

FRUITING OF CHIMONANTHUS FRAGRANS.—On visiting Normanton Park garden lately, I observed a tree of *Chimonanthus fragrans* bearing seed vessels of which I gathered a few to send for your inspection. The fruit is much smaller now that it is ripe, than it was early in the summer, when it was almost twice its present size. The tree is trained to a south wall, and is aged. I have never before seen this species in fruit. *W. H. Divers.* [The fruiting of this plant is not uncommon. Ed.]

NOTES FROM OAKWOOD.—On October 20 we finished putting the grease bands on our fruit trees to protect them against the female of the winter moth. This made its first appearance on November 4, on the 12th, moths came in quantity—we found eight on one tree, there seems to be something in the

garden at Oakwood attractive to moths, perhaps our wood or water. In the gardens here and at our cottage near, so few were caught last year (while we had many at Oakwood), that we have not banded the trees. I should doubt if the quantity of grease which finds its way through the Willesden brown canvas of which the bands are made, being enough to injure the bark; but to make sure, we have this year put a band of Willesden thick brown paper under the greased band. I shall be obliged if any of your readers who grow hardy Cyclamens successfully, would state whether they find sun or shade best for them. I know a splendid bed in Cheshire in complete shade where they bloom well and have beautiful leaves, but I still think that full sun is best for them. In our experience the corms grow larger in sun than in shade, and there are more flowers; but we find that, unlike many other alpine, the roots keep so near the surface that occasional watering is needful. There seem to be curious changes in the horticultural world, while members of the trade go on the Council of the Royal Horticultural Society, which used to consist of amateurs only, amateurs have begun to sell plants. I have to-day received some good plants sold by a clergyman in the country. *George F. Wilson.*

FRUIT-DRYING APPARATUS.—After seeing the recommendation in the *Gardeners' Chronicle* last July respecting fruit evaporators, I advised my employer, F. Ricardo, Esq., of Bromsberrow Place, to try one of the American Evaporators (Dr. Ryder's patent). I think it would be of interest to many of your readers if I were to give a little of my experience with this apparatus. In the first place, I can thoroughly confirm what the makers and introducers say respecting it. It is simple in construction, not liable to get out of order, and it may be worked with the greatest exactness as to temperature, and, with ordinary care and intelligence, anyone may use it; and although the machine works at a great heat, i.e., 167° F. up to 300° F., there is no danger from it catching fire, though the principal part is of wood, unless through carelessness or excessive firing. In drying any article, a rapid circulation of air is as necessary as heat, the degree of which must vary with the article to be dried and its condition. I have used the evaporator constantly this season, and have no hesitation in saying that it can be used for almost any kind of fruit or vegetable—in fact, for anything that requires to be dried to preserve it. It is the right thing in the right place; the consumption of fuel is very small—about 40 lb. a day for a No. 2 machine, and the price is very moderate, considering its great powers. At the Gloucester show this year, I exhibited sixteen samples of dried fruits, which were highly spoken of, both as to their appearance and quality. It is a thing which I venture to think ought to be more introduced into this country, where it would be the means of saving quantities of wholesome fruit in a season like the last. *W. A. Trotter.*

— We append the following remarks on the exhibition of dried fruits at Gloucester on November 9 and 10 which appeared in the *Worcestershire Echo*:— "I think one of the most interesting exhibits in connection with fruit culture was seen at the above show on Monday and Tuesday last, an exhibit which reflects great credit upon the enterprise of Mr. F. Ricardo, of Bromsberrow Place, Ledbury. The exhibit consisted of a variety of fruits, Plums, Pears, and Apples, grown at Bromsberrow, and dried at Bromsberrow by the process known in America as fruit evaporating. The samples shown were in point of appearance quite on a par with any samples imported from foreign countries, and in flavour evidently superior. The subject of profitable fruit-culture is at the present time a matter of great interest, and it has been proved conclusively that the best varieties of British-grown Apples will fetch considerably more money than the best varieties of American Apples; one grower in Herefordshire this year having realised 3s per cwt. for his Peasegood Non-ouch, when the best American Bilston Pippins were realising 19s. 3d. per cwt. Yet we are paying over eight millions of money yearly in the importation of foreign fruit. But still, though the best varieties will command good prices, there remains the question, what is to be done with the quantity of inferior fruits? The mode practised by our cousins across the Atlantic has been to select the best-grown fruits for the fresh fruit markets, and utilising the other by the evaporation process, and thus supplying us with the Apple ringlets and other fruits which we see exposed for sale in our grocers' and fruiterers' shops. Mr. F. Ricardo has been the first to illustrate to the landowners, farmers, and fruit-growers of this

neighbourhood the utility of this process in a practical manner; and the thanks, not only of the fruit-growing community, but of the general public, are certainly due to him for his enterprise, for he has proved that when a glut occurs in one kind of fruit, like there has been this year in egg Plums, instead of the grower having to part with them at an unremunerative price, he can preserve them and get a good price for them in the winter, when fruit is fetching prices almost prohibitive, or, at least, quite so to the working classes. Not only will this process save the destruction of enormous quantities of health-giving fruit in times of superabundance, or when the markets are overcrowded, but should other landowners, farmers, and fruit growers adopt the method, it must of a necessity be the means of improving our rural districts, as it would add a new industry to our almost depopulated villages. *J. G. Wilson.*"

HARDINESS OF PHLOXES.—Quite recently a lady related to me the following incident, anent some Phloxes of the decussata section. She had promised some roots to another lady friend, and told her gardener, who only tended her garden occasionally, to take off some pieces as he was digging the borders. This the gardener did, and he laid them for the moment in the path to add others of different kinds as he came to them. This was done, and the border duly finished, but it happened to be done just as the severe winter of twelve months ago set in, the result being, that the bits remained exposed to frost during the greater part of that memorable winter. But, singularly enough, the Phloxes appeared none the worse for the exposure; and what has been puzzling the giver is, that those pieces, after all the exposure, produced far finer heads than the original plants from which they were taken. Most probably, however, these latter were getting old, and the pieces taken from them would, by their being outside, be the youngest and most vigorous, which, coupled with a change of soil, would bring about the superior heads of bloom, in which item there is an obvious lesson. *J.*

FROST IN SOUTH WALES.—We had our first frost of the season on November 23, when the thermometer registered 5°, cutting down all the Dahlias, Beans, and other tender plants, which up to that time were looking fresh and green. *R. Milner, Penrice Castle, Swansea.*

BEGONIAS JOHN HEAL AND WINTER GEM.—Few more grateful or easier-managed subjects than these are grown to brighten the plant-houses during the dull winter months, as witness their cheerful effect in one of the structures at Messrs. Jax, Veiten & Sons, Chelsea, where they were both raised. Without considering the wonderful succession of flower which these neat growing plants give, the duration of each spray of their carmine-crimson blooms is very remarkable. Mr. Heal is still working on them, and further novelties equally desirable may be expected. Already, too, some fine double-flowered forms of this winter-flowering strain of Begonias are beginning to appear among the new batches flowered at Chelsea. They are useful for cutting, good for indoor decoration, and for any other purpose for which an easily-grown plant may be used. *J. O'B.*

THE CLASSIFICATION OF ROSE GROWERS AND OTHER EXHIBITORS.—I should like to make a few remarks in reference to your leading article signed "Rosa," pp. 639, 640. Not knowing who "Rosa" may be, I am unable to form any idea as to his practical knowledge. He, evidently, is retained on the side of the big growers, and he apparently thinks that a small grower can compete with advantage, rather than otherwise, against men who grow say, to quote his figures, 500,000! The absurdity of this must be obvious to any practical rosarian; a man who grows even 10,000 must have a large space to grow his Roses in, and he will also, in all probability, grow his 100 or so of varieties in 50's or more of each kind, whereas a small grower could, at the outside grow them in lots of five. This at once would put the small grower out of court in competing with his big neighbours. As every practical rosarian knows, that, given equal soils and ordinary conditions, a man who has a large number of plants, will on most occasions in the Rose-showing season, have several good exhibition Roses of each variety; a small man, on the other hand may possibly have one or two of them—in one case it is almost an absolute certainty, in the other a mere chance—his quality, of course, may be equally good. "Rosa" then harks back to the

same cry which has been repeated by others on this subject—"And who is to count them?" To judge from the way that Mr. Pemberton, Mr. D'Ombraun, and other leading rosarians write on this one point, readers of the gardening papers who are not rosarians, must consider us a very mean, and in fact, dishonest set of men as exhibitors—may no trust be placed in our statements? "Rosa" accentuates his poor opinion of us by broadly hinting that many of us who are local secretaries take advantage of our special knowledge to arrange our exhibits according to the entries of others. Now I am only personally acquainted with the shows at Croydon, Reigate, Sutton, and the Crystal Palace, and I will answer for the fact, that at none of these places is such advantage taken. At Sutton, I consider the local secretary shows in too many classes; but he can only take three prizes, and what he does is for the advantage of his local society, as he frequently clears off all the first prizes; and although it may annoy exhibitors who come from afar, he does nothing unfair in thus exhibiting. The only point on which I thoroughly agree with "Rosa" is, in his criticism on the division of classes into gentlemen's, gardeners', amateurs, and so on. Mr. Pemberton suggested some such division for the National Rose Society's shows; but whatever decision may be arrived at by the General Committee, or by those who may be present at the next annual meeting, I am certain that there would be endless unpleasantness if such an arrangement be adopted. I am sorry that your powerful journal should be throwing its weight on the side of the big growers, as I think any sympathy in the question should be on the side of the small rosarian, of whom I acknowledge I am one. *Charles T. Grahame, Croydon.* [We can scarcely be accused of taking sides with the big growers, seeing that our columns are open to both big and little alike, so long as they do not transgress the limits of fair criticism; and it is only by allowing each party to state his case, that there is any chance of our readers arriving at a fair estimate of any matter as a whole. Ed.]

TOMATOS AND CUCUMBERS FOR MARKET.—I should strongly recommend "N H C.," who enquired about the above in the *Gardeners' Chronicle*, p. 651 to grow Ham Green Favourite Tomato. I have grown it for three years, and found it to be a first-class fruit and an abundant cropper and free setter. The fruits are large, handsome, and fine-flavoured; and I can also recommend Hackwood Park Prolific, which is an excellent variety of Tomato when true. The best Cucumber, in my opinion, is Lockie's Perfection, a very prolific and handsome black spine, of a bright green colour, and of superior flavour, keeping without loss of flavour after being cut; and I should think it is one that would find ready sale. *W. Smythe, Basing Park.*

THE WORD "DAHURICUS."—I suppose Mr. C. Wolley Dod is correct in his explanation in the applied form of the word. Its meaning has perplexed me. Supposing it to be geographical, I searched indices, maps, and atlases, and tried the schoolmaster, but without avail—all resulted in failure. I sent to the Geographical Society, and they informed me, as Mr. C. W. Dod points out, "East of Lake Bukal," Siberia. I had seen a *Primula* catalogued as *P. dahurica*. The word is given in various forms to species of plants, such as *dahurian*, *dahuricus*, *daurica*, and *daurica*. I have been informed that *Daurica* is interesting in its flora, and that Fischer's *Primrose*, *P. nivalis*, grows there—I do not mean the *nivalis* of the *viscosa* species; there is one given in the *New Synopsis* as *P. nivalis*, Pallas, which, I think, may be the same. Mr. W. Dod is an authority on *Primulacæ*, and I wonder if he would kindly inform me whether it is in any English collection, or correct me if I am in error. *W. Withers, Brasted.*

JUBÆA SPECTABILIS ETC.—The two fine *Jubæa spectabilis* (*Cocos chilensis*) belonging to the firm Louis van Houtte, of Ghent, measure nearly 10 feet high by over 11 feet across. The trunk, covered with large shining scales, and in one case, it branches in an unusual way at a height of 1½ feet, and circumference of 6½ feet; and one of the branches bears twenty-eight large leaves, the other thirty. Two other specimens of lesser dimensions are nevertheless very interesting. This cool-house Palm is most effective when seen in summer in the middle of a large grass-plot. In the same establishment, the new *Bertolonia* of 1890 are in full leaf:—Baronne Adolphe de Rothschild,

with large leaves, and red veins; Madame Alfred Bleu, marbled and spotted with white; Madame Léon Say, more white than the last-named; and Baron A. de Rothschild, very handsome. *Alsophila australis robusta* is a very promising novelty. *A. B.*

A NEW ANGULOA.—We have received, through the kindness of M. L. LINDEN, L'Horticulture Internationale, Brussels, a flower of an Anguloa, said to be new, but which bears a very strong resemblance to *Anguloa uniflora*, an old inhabitant of our orchid-houses. A full inspection of pseudobulb and leaf is necessary before arriving at any decision as to the absolute identity of the new comer with *A. uniflora*.

SOCIETIES.

EYNSFORD COTTAGE GARDENERS.

NOVEMBER 16.—The members of the Eynsford Cottage Gardeners' Mutual Improvement Society, and several friends, were entertained at supper at the "Five Bells" Inn, by the generosity of Messrs. Cannell & Son, of the Swanley and Eynsford Nurseries. An invitation had been circulated to the members of the society to bring with them a dish of cooked Potatoes, and the first business of the meeting consisted of "sampling" some twenty-five dishes of Potatoes, and deciding on their various merits. After a careful test the palm was awarded to a new variety, raised by Mr. Robert Cannell, and known as Our Seedling; the next in merit being Cannell's Victory, followed by White Beauty, Snowdrop, and American Rose, in the order named.

After the supper was finished, Mr. Cannell, sen., took the chair, and Mr. J. D. Abbott, gr. to Sir W. Hart-Dyke, the vice-chair.

In the course of the evening the chairman said that he had decided to offer £6 in the form of prizes at the society's show next year, and it was for those present to decide the terms of the competition; it was eventually decided that the competition should take the form of a collection of eight varieties of vegetables, selected from exhibits of the Eynsford Society on the day of the show, matched against a similar collection of eight varieties, exhibited by any other similar society in Kent. The prizes to be divided as follows:—1st prize, £3; 2nd prize, £2; and 3rd prize, £1, with the proviso that no one society should take more than one prize.

BANBURY CHRYSANTHEMUM.

NOVEMBER 18—This took place in the Exchange Hall, and was in most respects an improvement upon that held last year. Groups of Chrysanthemums arranged for effect were a fine feature, and for the fourth time Mr. Baskett, gr. to W. Mewburn, Esq., Banbury, was awarded the 1st prize, with admirably-grown and bloomed plants, the flowers fresh, and of fine quality; Mr. Cummings, gr. to Jonathan Gillett, Esq., was a close 2nd.

Tables of foliage and flowering plants are always a good feature here; they are raised about 2 feet from the ground, and, facing each way, were very effective. The best came from Mr. Doherty, gr. to Lord North, Wroxton Abbey—a light and graceful arrangement; Mr. P. J. Perry, nurseryman, Banbury, was 2nd, with a nicely-arranged lot of plants, with the exception that they were too much packed.

Specimen plants of Chrysanthemums were shown in several classes, the Japanese varieties being preferred by growers. *Iliver Fleuri Mdle. Lacroix*, and Peter the Great, made the best specimens; in not a few cases the foliage was poor. Mr. Wingrove, gr. to G. H. Nelson, Esq., Rousham Park, and Mr. J. Green, Old Headington, Oxford, were the principal prize-winners.

In the cut flower classes, Mr. John Walker, nurseryman, Thame, was one of the principal prize winners. He was placed 1st with twenty-four varieties, twelve incurved and twelve Japanese. Mr. Neal, gr. to P. Southby, Esq., Bampton, was 2nd. With eighteen incurved varieties, Mr. Wingrove was 1st. These were set up with 8 inches or so of stem and foliage, and gained thereby in effectiveness. Mr. Neal was placed 2nd. Mr. Walker had the best twelve incurved, Mr. J. Green was 2nd.

The best eighteen Japanese came from Mr. F. J. Myers, who had a fine lot of blooms, fresh, and bright in colour. Mr. Wingrove was a good 2nd, also with fine blooms.

Mr. C. Green had the best twelve varieties; 2nd, Mr. McIntyre, gr. to Viscount Valentia, Bletchington Park, his stand containing a very fine deep-coloured incurved bloom of Mrs. W. E. Clarke.

Reflexed blooms were well shown by Mr. Baskett. Mr. Wingrove was a close 2nd. Anemone-flowered varieties were also good, Mr. Wingrove having the best twelve; Mr. McIntyre being 2nd.

Pompons and Pompon-Anemones made very pretty stands. Mr. A. E. Kirtland had the best stand of twelve bunches of the latter, Mr. Cummings was 2nd; with the former Mr. Wingrove was 1st, and Mr. McIntyre 2nd.

There was a class for twelve blooms of large-flowered Chrysanthemums, some with 9 inches of stem above the board; and here Mr. Baskett was 1st with a mixture of Japanese and incurved varieties in fine character, Mr. F. J. Myers being 2nd.

Chinese Primulas, double and single, were numerous and good.

Epergues, bouquets, and baskets of Chrysanthemums, arranged by ladies, were a pretty feature, and attracted much attention. A tendency to overcrowd was traceable in most of them.

Fruit.—The best eight dishes of Apples came from Mr. Wingrove, who had fine fruits of Cox's Pomona, Peasgood's Nonsuch, Blenheim Orange, Cox's Orange Pippin, Court Pendu Plat, &c.; Mr. Doherty was 2nd. Mr. Doherty had the best six dishes of Pears. Grapes were represented by finely finished Ailcante from Mr. W. C. Cartwright; and by Gros Colmar from Mr. Doherty; and White Muscats from Major Norman and Mr. A. V. Cross.

Potatoes were shown in collections of nine dishes and six dishes; in the one case, Mr. E. S. Wills, The Gardens, Edgecote Park, was 1st, and in the other Major Norman. Onions were not so fine as usual, but Mr. Pope, gr. to the Earl of Carnarvon, Highclere, was 1st, with Deverill's Anglo-Spanish, fully finished; Major Norman was 2nd, with Deverill's Ailsa Craig.

Mr. Perry, Banbury, and Mr. J. Clow, seedsman, Banbury, had some pretty floral decorations, not for competition, both of which were highly commended.

HAREFIELD HORTICULTURAL.

The Chrysanthemum show which was held recently at the Memorial Hall, under the auspices of the above society, was quite a success, there being a good display of cut-blooms and pot plants.

The cut flowers exhibited by Mr. J. C. Mundell, gr. to Lord Ebury, Moor Park, were very fine, as also were those staged by A. H. Tarleton, Esq., Breakspears (gr., Mr. H. J. Bull), and Mr. Hearo, gr. to Mrs. Goodlake, Deaham Fishery.

The group of pot plants exhibited by Mr. W. Batchelor, gr. to Colonel Vernon, Harefield Park, attracted much attention, and the groups staged by Messrs. Bennett, Bull, and Milton were highly meritorious.

Mr. Bennett, manager to Mr. G. Webster, Harefield Grove, staged a capital lot of Apples, Grapes, Tomatoes, Cucumbers, and Mushrooms; and Mr. Mundell showed Apples, Pears, and Grapes in good condition.

Obituary.

MR. FRANZ KRAMER.—We regret to inform our readers of the death, on November 22, of Mr. Franz Kramer, head gardener to Herr Legationsrath Rucker-Jenisch, of Flottbeck, Hamburg. Mr. Kramer had, for about thirty years, charge of one of the most renowned continental Orchid collections, that of the late Senator Jenisch. He was well known in English horticultural circles, and generally esteemed both for his character and his abilities as a gardener. The situation having been held by his family for several generations, it is likely that it will be filled by his eldest son.

ROBERT COWAN.—The numerous friends of Mr. Robert Cowan, formerly partner in the firm of Messrs. Kennedy & Co., nurserymen and seedsman, Dumfries, will regret to learn of his death, which took place suddenly, from heart disease, on the 23rd ult., at his residence, Birkhill, Dumfries. In partnership with the late Mr. Newbigging, Mr. Cowan conducted the important business of the firm named since 1856, till, on the death of his partner, about six years ago, he retired from business. In his earlier years, Mr. Cowan served in the establish-

ment of Messrs. Peter Drummond & Sons, Stirling, and also in that of the firm of Drummonds, of Dublin. Mr. Cowan was a keen horticulturist, and a warm supporter of every progressive movement in horticultural matters.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

REPORT OF THE APPLE CONGRESS, 1883.—Will any reader of the *Gardeners' Chronicle* possessing clean copies of the above, kindly communicate with the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster, S.W.

PLANTING AN AVENUE WITH ELMS.—"J. M." intends to plant one side of an avenue with Elm trees, and desires to introduce as many varieties as possible at the same time wishing the trees to harmonise one with another when they are old. He would be obliged if any of our readers would, through the medium of our columns, give him a list of varieties that would be suitable for this purpose. The sub-soil is clay and gravel.

THE "CONCORD TREE."—Can any of our readers furnish "R. P." with the botanical name of the plant which is known in New Zealand as the "Concord Tree," the seeds of which are very large, and the foliage pinnatifid?

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.		
	ACCUMULATED.				10ths In.	Ins.	Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 4, 1891.	
	Above (+) or below (-) the Mean for the week ending November 25.	Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since Jan. 4, 1891.					Below 42° difference from Mean since Jan. 4, 1891.

12	2	28	5	— 56 + 44	2	175	32.1	44	47

The districts indicated by number in the first column are the following:—

- 1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending November 28, is furnished from the Meteorological Office:—

"The weather during this period varied considerably in different parts of the Kingdom, but was as a whole rather fairer than that experienced previously, especially over England and the east of Scotland.

"The temperature was below the mean in all districts, the deficit varying from 2° in the 'Channel Islands,' to 4° in most other districts, and to 5° in

'Scotland, E. and W.' and 'Ireland, S.' The highest of the maxima, which were registered in most instances on the 28th, ranged from 53° in the 'Channel Islands,' 'England, S.W.,' and 'Ireland, S.,' to 46° in 'England, N.E.,' and the 'Midland Counties.' The lowest of the minima were recorded during the middle part of the period, when the shaded thermometer fell to 16° in 'Scotland, E.' (at Braemar), to between 20° and 25° in most other districts, but to only 35° in the 'Channel.'

"The rainfall slightly exceeded the mean value in 'England, N.W.,' and equalled it in 'Ireland, S.' In all other districts there was a deficit, and in 'Scotland, N. and E.," this deficit amounted to 5-10ths of an inch.

"The bright sunshine shows a considerable increase on that recorded last week, and has exceeded the mean for the time of year in nearly all districts. The percentage of the possible duration ranged from 14 in 'Scotland, N.,' and 18 over 'England, N. and E.,' to 36 in 'England, S.,' 43 'England, S.W.,' and 44 in the 'Channel Islands' and 'Ireland, S.'"

POTATOS.

Heavy arrivals and mild weather have had the effect of lowering prices for all kinds. There is an indication to put prices still lower for next week. Stocks increasing. J. B. Thomas.

SEEDS.

LONDON, Dec. 2.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report a American Red Clover seed dearer. Rather more doing in Trefoil. Alsike still scarce; white held for full prices. Ryegrasses, owing to continued heavy export demand, exceedingly firm. Blue Peas strong, but with somewhat less excitement; higher quotations are confidently anticipated later on. Haricots still hardening. Canary and Hempseed both extremely steady. Millet unchanged. Linseed dull.

FRUITS AND VEGETABLES.

SPITALFIELDS: Dec. 1.—Quotations:—English Apples, 2s. to 5s. per bushel; American do., 10s. to 16s. per barrel; Pears, 1s. 6d. to 3s. per half-sieve; English Tomatos, 1s. 6d. to 6s. 6d. per peck; foreign do., 1s. to 1s. 6d. per box; Sea-kale, 1s. to 1s. 6d. per punnet; Cabbages, 1s. to 1s. 9d. per tally; Savoys, 2s. to 2s. 6d. do.; Cauliflowers, 5s. 6d. to 8s. do.; Greens, 1s. to 1s. 6d. per dozen bunches; Turnips, 1s. 6d. to 2s. do.; Carrots, 1s. to 2s. 3d. do.; Parsley, 1s. 6d. to 2s. do.; Spinach, 1s. 6d. to 1s. 9d. per bushel; Brussels Sprouts, 1s. 6d. to 1s. 9d. per half-sieve; Parsnips, 4d. to 9d. per score; Endive, 6d. to 1s. per dozen; Leeks, 1s. 6d. to 2s. do.; Cabbage Lettuce, 4d. to 8d. do.; Mustard and Cress 1s. 6d. to 2s. per dozen baskets; English Onions, 5s. to 5s. 6d. per cwt.; Bordeaux, 4s. to 4s. 9d. per case; Belgian do., 3s. to 4s. 6d. per bag of 110 lb.; Dutch do., 3s. 3d. to 4s. 6d. do.; Celery, 6d. to 1s. per bundle; Horse-radish, 1s. to 1s. 1d. do.

BOROUGH: Dec. 1.—Quotations:—Cabbages, 2s. to 3s.; Savoys, 2s. 6d. to 3s.; Broccoli, 5s. to 8s. per tally; Spinach, 2s. to 3s. per bushel; Turnips, 1s. to 1s. 6d.; Carrots, 1s. to 1s. 9d. per dozen bunches; English Onions, 4s. 6d. to 5s. per cwt.; do. Apples, 2s. to 6s.; Pears, 2s. 6d. to 7s. per bushel; Canadian Apples, 12s. to 25s.; Newtown Pippins, 18s. to 45s. per barrel.

STRATFORD: Dec. 1.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Cabbages, 2s. to 3s. per tally; Savoys, 3s. to 5s. do.; Greens, 1s. 3d. to 1s. 6d. per dozen bunches; Cauliflowers, 9d. to 1s. 6d. per dozen; do., 4s. to 7s. per tally; Turnips, 1s. 9d. to 2s. 3d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 36s. to 45s. do.; do., cattle-feeding, 25s. to 32s. do.; Parsnips, 60s. to 70s. per ton; Mangels, 14s. to 18s. do.; Swedes, 18s. to 25s. do.; Onions, English, 90s. to 125s. do.; do., Dutch, 4s. to 4s. 9d. per bag; do., Bordeaux, 5s. 3d. to 6s. per case; do., Oporto, 7s. 6d. to 8s. do.; Apples, English, 2s. to 6s. per bushel; American, 12s. to 20s. per barrel; Celery, 6d. to 1s. per roll; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. to 2s. 6d. per sieve.

POTATOS.

SPITALFIELDS: Dec. 1.—Quotations:—Magnums, 55s. to 70s.; Regents, 55s. to 65s.; Imperators, 60s. to 75s.; Hebrons, 60s. to 70s.; Snowdrops, 55s. to 75s. per ton.

BOROUGH: Dec. 1.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 85s.; Bruces and Magnums, 70s. to 90s. per ton.

STRATFORD: Dec. 2.—Quotations:—Magnums, 60s. to 85s.; Elephants, 65s. to 85s.; Hebrons, 65s. to 80s.; Imperators, 65s. to 90s. per ton.

NOTICES TO CORRESPONDENTS.

ARTIFICIAL MANURE, NITRATE OF SODA, &c. A. P. Apply these when the crops are growing, or just before growth begins. Two or three applications may be made during the season of growth at intervals of a month or six weeks, and in showery weather. If there is much Clover in the grass, the use of nitrate will cause very rapid growth, and much of the grass would be smothered out of existence, probably. Which is the most valuable to you? Potash would be a better manure.

BOOKS: J. H. B., *Havre de pas*. Get *Select Ferns and Lycopods*, by the late B. S. Williams, Paradise & Victoria Nurseries, Holloway, London, N., where also it may be purchased, price about 5s.—BUTTER MAKING: A. Y. Z. *Dairy Farming, and Management of Cows*. By A. Roland. Chapman & Hall (Limited), London.

CANNOTS: D. G. Some of the stumpy thick Carrots, of recent introduction, are, as you say, deficient in thickness of outer layer of flesh, whilst the core is very large in proportion. We do not regard this as any improvement, but the reverse. If your soil is deep and good, grow Altringham, which is almost coreless; Long Surrey, and Coreless Long Red, which resembles the early Nantea variety, but is longer, and therefore more productive.

CHRYSANTHEMUMS: *Constant Reader*. The stems being of annual growth and duration, cannot be preserved to serve as a base for a future plant.—W. L. Send it to a nurseryman who makes the cultivation of these flowers a specialty.

CORRECTIONS: *Yeovil Chrysanthemum Show*. Mr. B. R. Davis, Nurseryman, of Yeovil, was credited with showing "12 dishes of fruits," whereas he showed 76, of which number 72 were Apples and Pears.—*Librarian and Assistant Secretary, Linnean Society*. We gave in Answers to Correspondents in our issue for November 28, the name of Dr. Murie, when it should have been J. E. Harting, Esq.

CUCUMBERS: T. H. The roots are infested by eel-worms, which are the cause of the death of the plants. There is no known cure. Clear out all

plants and soil, and make a fresh start with other kinds of soil and plants from a distance.

CYCLAMEN: *Constant Reader*. One of the garden forms of *C. persicum*.

DOUBLE-BLOSSOMING CHERRY: A. P. Either by budding or grafting; preferably the former in late summer.

EUCCHARIS AMAZONICA: W. A. S. The Eucharis Mite has attacked the bulbs. We know of no means of ridding the bulbs of these insects. Isolate the bulbs that are doing badly from the rest of the stock, or burn them.

FORESTRY JOURNAL IN LONDON: A. Mitchell. There is no weekly journal on forestry published in London; but a periodical appearing monthly, and called *Forestry*, is published by Anderson, 145, Queen Victoria Street, London, E.C. Price 1s. Forestry subjects are also pretty fully discussed in these columns. We do not know the address of the Secretary of the Society.

HOLLIES AND PAMPAS-GRASS: G. A. S. An excellent mode of planting the former is on raised beds or mounds. If the first-named plan be adopted, the bed should not be less than 20 to 25 feet in diameter, and it may be constructed in two terraces or levels, the larger plants, golden or green, being planted wide apart on the top one, and golden Euonymus, or small golden variegated Conifers, mixed Gold and Silver Hollies, Privet, &c., on the lower one. The retaining sides of the terraces should be formed of stout tarves, and should be given a "batter" sufficient to prevent their slipping down. This mode of making a Holly-bed is fit only for geometrically-formed parterres, the central object in a carriage-sweep, or a position but slightly removed from some architectural object. A more natural way is to plant on a gentle eminence (artificial or otherwise), planting the Hollies 8 to 10 feet asunder, and turfing the ground to within 3 feet of the stems. The Pampas-grass looks best in a group consisting of 5 to 9 plants, with sufficient space between them to prevent crowding for many years to come. The spot should be a sunny one, and the land in good heart, and very efficiently drained, as to have large plants in a short time liquid-manure in large quantities should be afforded them in the summer.

LIME AND FARM-YARD DUNG: A. P. Mix lime with the dung, if you want rapid decomposition. But this is best done in the compost-heap. Do not apply fresh lime to your lawn or grass-land.

MUSCAT VINE: *Hortus*. If the proposed stock for the Muscat is vigorous, inarch one or two Muscat Vines on it in the summer, using half-ripened shoots on stock and graft. The edges of the two surfaces must coincide exactly. The older wood may also be inarched when the Vine has made a few leaves in the spring.

NAMES OF FRUITS: *Full*. 1, Brownlee's Russet; 2, Golden Russet; 3, Schoolmaster; 4, French Crab; 5, Claygate Pearmain; 6, Alexandre Lambre; 7, not recognised; 8, Washington.—W. Parker, 1, decayed; 2, Josephine de Malines; 3, Winter Crassane; 4, not recognised; 5, Bishop's Thumb; 6, Lord Grosvenor; 7, Tom Putt; 8, New Rock Pippin.—A. F. 3, Jolly Beggar; 4, Tower of Glamis; 6, Waltham Abbey Seedling; 7, not known.—C. P. Lee, 1, Mère de Ménage; 2, Kentish Codlin; 3, Braddick's Nonpareil; Pear Uvedale's St. Germain.—James Young, 1, Kirke's Lord Nelson; 2, Tom Putt.—W. Austin, 1, Beurré d'Aremberg; 2, Winter Nelis; 3, Winter Crassane.—D. C., Hereford, 1, Rymer; 2, Golden Reinette; 3, not recognised; 4, Minchall Crab; 5, Gravenstein; 6, Grange's Pearmain.—B. Middleton, 1, Beurré Boac; 2, Vicar of Winkfield; 3, Bergamotte d'Espere; 4, Eyewood; 5, Triomphe de Jodoigne; 6, Duchesse d'Angoulême.—A. Woodgate, 1, Beachamwell; 2, Pigénette; 3, Franklin's Golden Pippin; 4, Fearn's Pippin.—W. Guy, 1, Besspool; 2, Pine Golden Pippin; 3, Dutch Mignonne; 4, London Pippin.—*Quintin Read*. The number you have sent far exceeds our utmost limits: 1, 2, Cox's Pomona; 3, Frogmore Prolific; 4, 9, 15, 23, Dumelow's Seedling; 5, 6, Hawthornden; 7, 10, 12, 16, Claygate Pearmain; 11, 12, Cox's Orange Pippin; 8, Sturmer Pippin; 17, 20, Court Pendu Plat; 14, Minchall Crab; 24, Red Quarrenden.

NAMES OF PLANTS: J. Robinson. *Adiantum cuneatum mundulum*, *Nephrodium molle* (not British).—L. C., Rugby, 1, *Cattleya superba*; 2, *Cattleya luteola*; 3, *Oncidium Phalaenopsis*.—A. A. Epiden-

drum pnsillum, new species. See p. 669.—*Oxon.*
Epidendrum ciliare, *Dendrobium palpebrae*.—*H. J. R.* 1, *Laelia pumila*; 2, *Laelia pumila* Day-
 ana; 3, *Cattleya Walkeriana*, if not of dwarf
 growth; if dwarf, aend specimen of growth; 4,
Miltonia Russelliana; 5, *Oncidium aurosum* (ex-
 cavatum); 6, *Cypripedium longifolium*.

PALM LEAVES DISEASED: *H. D. H.* The leaves are
 attacked by a destructive fungus, *Pestalozzia*
phoenicea; see *Gardeners' Chronicle*, October 4,
 1884, p. 429. Cut off and burn all affected parts.

PANCRATIUM ILLYRICUM NOT GROWING: *Hortus.* No
 effort should be made by using heat to force out
 roots; better results would follow keeping the
 bulbs cool and moderately moist; and if it keep
 sound, roots will form. Slightly scoop out the
 base of the bulb, or make two transverse slits
 in it.

PRIMULAS: *W. Dean.* The varieties sent are very
 robust in growth, flowers large, and colours
 pleasing.

QUINCES IN THE PLEASURE-GROUNDS: *P. A.* They
 are beautiful bushes when in bloom, and the fruit is
 always in demand. We wonder why people seldom
 think of planting them in their pleasure-grounds
 and gardens. The Quince likes a warm, open spot,
 in well-drained land. Do not be satisfied with
 one specimen only.

RATING MARKET GARDENS: *T. C.* See *Gardeners*
Chronicle, vol. i., 1877, pp. 422 and 650 (Purser
 v. Worthing Local Government Board); and
 Purser's Appeal, p. 676, same vol.

RHODODENDRON MADDENI GRAFTING: *A. P.* The
 stocks—common *R. ponticum* or *R. catawbiense*—
 should have been at least one year in pots. The
 mode of grafting: side, crown, or tongue. Time:
 the spring, in a cool-house, with scions of the
 previous year's growth; or late in the summer.
 Leave most of the leaves on the scion, and a leaf
 or two at the top of the stock; cover the point
 of union with grafting-wax, and keep the worked
 stocks in a close handlight or frame. Dew them
 over occasionally; see that the stocks do not want
 for water at the root, and shade from bright
 sunshine.

TENANT LEAVING NURSERY: *Seedsman.* Saleable
 nursery stock may be removed; and usually a
 year or more time is allowed for its removal. Old
 fruiting, and generally permanent trees and shrubs,
 must be left in the ground. The landlord is not
 obliged to pay you for them. You must also leave
 the greenhouse, if it be fixed with bolts or screws
 to the brickwork; but the heating apparatus is a
 trade fixture, and removable by the tenant.

TO MAKE A TUD OF URINE ODOURLESS: *Dido.* We
 do not think that you can do anything to remove
 the smell, unless you mix the urine with a large quantity
 of dry clayey loam, which will make in the dry
 state a good top-dressing for plants or turf. The
 kind of soil mentioned will absorb urine five or six
 times, if it be dried after each addition of the
 same. It is then a strong manure, and needs
 caution in its use.

WEEVILS AND MARGUERITES: *Brutus.* Both the
 grubs and the perfect insect are destructive to
 plants, the former living in the soil and gnawing
 the roots and underground parts of the stem, and
 the latter feeding at night on the leaves, tender
 shoots, and buds. The grubs are most difficult to
 rid soil of when it is planted; but gas-lime, soot,
 and salt dug into it after the crop is off, well
 exposing it to the air by after-forking over, so that
 the birds can destroy the grubs, is as good a
 remedy as any. In the case of the beetles, you
 must search for them at night with a light; a dark
 lantern is best. Spread a white cloth or piece of
 paper under the plants, and then turn on the light.
 The weevils will drop suddenly on to the cloth,
 and try to escape. You must be quick, and catch
 as many as you can. Repeat this nightly, and you
 will considerably thin their numbers. Scalding
 water thrown into chinks, cranies, and under
 stones and clods, where the weevils hide, will kill
 many more.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists.

in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by

DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London

"Nothing Succeeds like Success"

HUGHES' SOLUBLE) FIR TREE OIL

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

W. HERBERT & CO.,
Hop Exchange Warehouses, Southwark Street, London, S.E.

AUTUMN and WINTER PRUNING, TRIMMING, and THINNING OUT can be better and quicker done by the **STANDARD MANUFACTURING COMPANY'S** Celebrated **TOOLS**, including the "STANDARD" and "GIANT" TREE PRUNERS, the "MYTICUTTAH," and other useful appliances, than by any means. They were shown in actual use at the recent Horticultural Exhibition, Crystal Palace, and at the great Agricultural Shows at Bath and Doncaster; thousands of visitors being astonished at their wonderful power and scientific efficiency, coupled with great saving of time and labour, and the work to life and limb reduced. After Stormy Weather, these Tools will be found invaluable for cutting off fractured branches, leaving the ends severed in a vital condition.

Illustrated CATALOGUES can be had, post-free, from the **PATENTEES and MAKERS**, at their works and depot, **ST. ALMUND'S CHURCHYARD, DERBY**; or of the principal Ironmongers and Seedmen, the leading stores, and kindred trades throughout the world.

PRED SILVESTER & CO.,
CASTLE HILL WORKS, NEWCASTLE, STAFFORDSHIRE

CHRYSANTHEMUMS,

And How to Grow Them. By C. E. SHEA, Esq. A Practical and Scientific Treatise, that will be of great service, both to the oldest and most successful exhibitor and the youngest grower of the Autumn Queen. Mr. Shea has, by the treatment explained in his treatise, had a long series of triumphs, to which this season he has added, in keen competition with our most noted growers, at the Kent County, Watford, and Crystal Palace, finishing with the difficult feat of 1st in the 48 Japanese, at the Royal Aquarium Show, Nov. 10. In addition to the above, a paper by Mr. H. Shoosmith is included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world. This valuable work is now ready, post free, seven stamps. H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham.

DR. SMILES'S WORKS.

JASMIN: BARBER, POET, PHILANTHROPIST. "Il rasant bien, il chantait mieux. . . Si la France possédait dix pêches comme Jasmin, dix poëtes de cette influence, elle n'aurait pas à craindre de révolutions."—Sainte Beuve. LIFE AND LABOUR; OR, CHARACTERISTICS OF MEN OF INDUSTRY, TALENT, AND GENIUS. 6s. MEN OF INVENTION AND INDUSTRY. 6s. THE HUGUENOTS: THEIR SETTLEMENTS, CHURCHES, AND INDUSTRIES IN ENGLAND AND IRELAND. Crown 8vo. 7s. 6d.

6s. each. SELF-HELP. THIRIFT. CHARACTER. DUTY. SELF-HELP IN FRENCH. 5s.

INDUSTRIAL BIOGRAPHY. 6s. LIVES OF THE ENGINEERS. Illustrated. 5 vols. 7s. 6d. each.

"We cannot but refer to the captivating and instructive volumes which Dr. Smiles has devoted to the "Lives of the Engineers," a record not before attempted of the achievements of a race of men who have conferred the highest honour and the most extensive benefits on their country."—Edinburgh Review.

LIFE OF GEORGE STEPHENSON. With Illustrations. 21s.; 7s. 6d.; or 2s. 6d.

"We have read this book with unmingled satisfaction. We hardly ever remember to have read a biography so thoroughly unaffected. . . It is an artless attempt to set out the character and career of one of the most ingenious, honest, resolute, homely, and kind-hearted of human beings. The entire style of the work is unambitious, lucid, thoroughly manly, and good."—Saturday Review.

JAMES NASMYTH, ENGINEER: AN AUTOBIOGRAPHY. With portrait and 90 Illustrations. 16s. and 6s.

LIFE OF THOMAS EDWARD, Scotch NATURALIST. Illustrated by George Reid, P.R.S.A. 6s.

LIFE OF ROBERT DICK, GEOLOGIST AND BOTANIST. Illustrated. 12s. "Men of Dick's type are rare; their example is too precious to be lost; but they are themselves the last to recognize their own value. His motto and his watchwords, in the energy of his younger labour, as in his refusal to yield to the pressure of his later troubles, were, *Work, Devotion, High Endeavour*—in a word, that *Self-help* which is the foundation of all help to others."—Quarterly Review.

JOHN MURRAY, ALBEMARLE STREET, W.

L. REEVE & CO.'S NEW WORKS.

New Vol. XLVII. for 1891, 42s. cloth. THE BOTANICAL MAGAZINE. Figures and Descriptions of New and Rare Plants. By Sir J. D. HOOKER, F.R.S., &c. Third Series. Vols. I. to XLVI., each 42s. Published monthly, with six plates, 3s. 6d. coloured. Annual subscription, 42s.

BRITISH FUNGI, Phycomycetes and Ustilaginifer. By GEORGE MASSEE (Lecturer on Botany to the London Society for the Extension of University Teaching). Crown 8vo, with 8 Plates, 7s. 6d.

BRITISH FUNGICOLOGY. By the Rev. M. J. BERKELEY, M.A., F.L.S. Re-issue. With a Supplement of nearly 400 pages by WORTHINGTON G. SMITH, F.L.S. 2 vols. 24 coloured plates, 36s.

A few copies of the Supplement may be had separately, post-free, by remitting 12s. to the Publishers.

THE NARCISSUS: its History and Culture. By F. W. BURBIDGE, F.L.S.; with a Scientific Review of the entire Genus, by J. G. BAKER, F.R.S., F.L.S. With 48 beautifully coloured plates. Super royal 8vo, 32s. "Mr. Burbidge has culled from various sources a large amount of valuable or interesting information. . . It is no slight boon to have in so accessible a form so large a series of illustrations."—Gardener's Chronicle.

FLORAL PLATES from the FLORAL MAGAZINE. Beautifully coloured, for Screens, Scrap-books, Studies in Flowering-painting, &c. 6d. and 1s. each. Lists of over 1000 varieties, One Stamp.

BOTANICAL PLATES from the BOTANICAL MAGAZINE. Beautifully-coloured Figures of new and rare plants. 6d. and 1s. each. Lists of nearly 3000, Three Stamps.

MIDLAND COUNTIES HERALD

SUPPLIED FREE FOR SIX WEEKS, on stating the purpose for which the paper is required, forwarding Name and Address, and six halfpenny stamps for postage, addressed, "Midland Counties Herald Office, Birmingham." The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms. SPECIMEN FREE. Price 2d. Published Friday for Saturday.

TO FLORISTS.—A young Lady requires situation.—First class hand in all branches of the Trade. A good Saleswoman. References from present employer.—RIGBY, 31, Finkle Street, Kemnal.

HOLLOWAY'S PILLS AND OINTMENT.

—Bilious affections with all their concomitant annoyances induced by atmospheric changes, or too liberal diet, should be checked at once, or serious consequences may ensue. When any one finds his ideas less clear than usual, his eyesight dimmed, and his head dizzy, accompanied by a disinclination for all exertion, physical or mental, he may be quite sure that he is in immediate need of some alterative medicine. Let him at once send for a box of Holloway's Pills, a mild course of which will remove the symptoms, and speedily renew his usual healthful feeling. If the bowels be irritable, Holloway's Ointment should be diligently rubbed over the stomach and liver every night and morning.

FOREST TREES.

IRELAND & THOMSON

HAVE TO OFFER A LARGE AND FINE STOCK OF

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE on WEDNESDAY NEXT, December 16. On view morning of Sale, and Catalogues had.

East Dulwich, S.E.—Wednesday Next, December 16. (Close to East Dulwich Railway Station.)

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, The Orchid Nurseries, East Dulwich, London, S.E., on WEDNESDAY, December 16, at half-past 12 o'clock, by order of Messrs. Seeger & Tropp, a fine lot of ESTABLISHED HEALTHY ORCHIDS, among which will be included many exceedingly well-grown specimens and half-specimens, also choice new, and rare species and varieties; a specially large number of Orchids in bud or flower; a great quantity of semi-established Orchids most useful for cut flower purposes, and a collection of VANDAS, numbering about 65 plants, embraced in which are unique specimens and special varieties, such as TRICOLOR ROLLESSIONI, T. DALKETH VARIETY, T. PANIUBATA, T. PATERSONI, T. CINNAMOMEA, T. NIVEA, T. TIGRINA, SUAVIS VEITCHI, BATEMANNI, STORIEI, KIMBALLIANA ANESTIANA, CATHCARTI, GIGANTEA, COCCINEA, TERES, PARISHI, CHERULESCENS, STANGIANA, and many plants of TRICOLOR and SUAVIS that have not yet flowered in Europe, as to which it may be relied on that no two will be alike. These already flowered have proved to be each different, and one of them entirely yellow. Any Gentleman about forming a collection of Vandas will find this an exceptional opportunity to acquire a great variety of really excellent plants for immediate effect, and a special visit to the Nurseries (which are distant only 12 minutes by train from London Bridge Station, L. B. & S. C. Ry.), is invited, to inspect this marvellous group, if for that purpose only. It can be asserted with confidence that never before has such a perfectly grown and healthy lot of Vandas been submitted for public competition. In the event of the lot as catalogued failing to find a purchaser, the plants will be sold individually.

Plants will be on view the morning of sale. Catalogues had on the premises and of the auctioneers, 67 and 68, Cheapside, London, E.C.

The Orchid Nurseries are within five minutes walk of East Dulwich railway station, L. B. and S. C. Railway.

Should frost prevail on the day of sale, the plants purchased may remain in the care of Messrs. Seeger and Tropp until the weather is favourable for their despatch.

Balham.—Clearance Sale. Close to Station.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the Balford Hill Nursery, Larch Road, Balham, on THURSDAY NEXT, Dec. 17, at 1 o'clock, without reserve, 7 Span-roof GREENHOUSES, 1300 feet of 4-inch Hot-water PIPING, BOILER, BRICK-WORK; also the stock of GREENHOUSE PLANTS, including a fine lot of specimen White Azaleas and Camellias, Flower Pots, &c.

On view two days prior to the Sale. Catalogues had on the Premises; of Messrs. MARCHANT and BENWELL, Solicitors, Broadway, Deptford, and 2, George Yard, Lombard Street, E.C., and of the Auctioneers, 67 and 68, Cheapside, E.C.

N.B.—THE FREEHOLD NURSERY is to be SOLD for building purposes.—Particulars of the Auctioneers.

Friday Next. GREAT SALE OF ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, December 18, at half-past 12 o'clock.

Another Importation of Lindley's OLD LABIATA, from far beyond Swainson's hunting-grounds, and from a much higher elevation. Also

The OLD LABIATA, established and semi-established. The OLD LABIATA, in sheath.

GARDNER'S LABIATA, Semi-established, unflowered, grand plants.

Every plant will be offered, collected by the late W. Dujance fifteen days before his death from yellow fever. This is an early autumn-flowering labiata, very free, very beautiful, and not surpassed by any member of the family.

It must not be confounded with any other labiata. Also a grand lot of CYPRIPEDIUMS, many being fine Specimen Plants, and many new hybrids.

- New and rare MASDEVALLIAS,
New and rare DENDROBIUMS,
New and rare EPIPEDIUMS,
new CATTLEYAS, new PHAJUS, new SPATHOGLOTTIS,
New and rare CYMBIDIUMS, from the Himalayas.
Cool ORCHIDS, in bud and bloom.
Warm ORCHIDS, in bud and bloom.

On view morning of Sale, and Catalogues had.

MESSRS. PROTHEROE AND MORRIS will include in their ORCHID SALE on FRIDAY NEXT, December 18,

A magnificent lot of splendidly-grown CYPRIPEDIUMS, the property of a gentleman giving up the cultivation of these plants.

Amongst them are grand specimens of the following:—

Table with 2 columns: Cypridium Boxallii and Cypridium Morganii. Lists various species like caricinum, cardinale, concolor, Dautherrii, Ibris, Elliotianum, Harrisianum, hir-sutum, Haynaldianum, miridissimum, Rothschildianum, Schlimi, Schomburgkianum, Sedoni porphyreum, Spicerianum, superbiens, villosum, Weidlichianum.

And many fine plants of other choice and rare varieties. On view morning of Sale, and Catalogues had.

Friday Next.—Orchid Sale.

MESSRS. PROTHEROE AND MORRIS will also include in above SALE, a fine lot of GLORIOSA SUPERBA and IPSEA SPECIOSA, which will be Sold, without reserve.

Friday, January 8, 1892. PRELIMINARY ANNOUNCEMENT.

LINDEN'S GRANDEST DISCOVERY: CATTLEYA REX, JAMES O'BRIEN.

THE MOST FAMOUS ORCHID EVER INTRODUCED. J. LINDEN, the discoverer and first introducer of nearly all the finest Cattleyas in cultivation, viz., CATTLEYA AUREA, AMETHYSTOGLOSSA, GIGAS, ELDOBRADO, TRIANÆ, WAROCQUEANA (LABIATA AUTUMNALIS), &c., confidently recommends—

CATTLEYA REX as the FINEST OF THE GENUS.

CATTLEYA REX FLOWERS IN DECEMBER and JANUARY. Some amateurs have stated CATTLEYA REX to be a grand form of Cattleya aurea, with white sepals and petals, but it is a QUITE NEW TYPE.

CATTLEYA REX is described by JAMES O'BRIEN in the Gardeners' Chronicle, December 13, 1890.

Sepals and petals are creamy-white. The labellum is of the richest crimson, of various shades—from the rosy hue to the purple tint—veined in a beautiful manner with golden-yellow, all worked in to form a richly-colouring marbling. "It is a Wonderful Piece of Colouring."

Mr. R. JOHNSON, Stund Hall Gardens, Whitefield, Manchester, writes to Messrs. LINDEN:—

"The CATTLEYA REX has flowered with us, and a grand thing it is. We have had some of the principal importers of Orchids here to see it; they think your plate in Lindena (English edition, Part I., 1891) a true representation of the flower, but the lip of our flower is FINER than your Plate."

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Messrs. LINDEN, L'Horticulture Internationale, Brussels, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY January 8, 1892, at half-past 12 o'clock, the whole of the above importation, just to hand in capital condition.

The plants have been collected by Messrs. Linden's intrepid collector, M. C. Ellner, with the greatest difficulties, who has searched with hundreds of natives for two years after this grandest Cattleya, and only succeeded in discovering those offered.

He states that "it is impossible to find any more." A portrait made from a plant flowered in Monsieur Warocque's collection will be on view on the day of Sale.

On view morning of Sale, and Catalogues had.

Orchids in Flower for Christmas Decoration.

THOMAS B. JAMES (many years with Protheroe & Morris) will SELL by AUCTION at his Commodious Sale Rooms, Bull Ring, Birmingham, on TUESDAY, December 22, at half-past 12 o'clock, 300 lots of ORCHIDS (every plant being in flower or bud) for Christmas decoration. Growers desirous of including are requested to send list per return.

T. B. JAMES holds SALES every WEDNESDAY and FRIDAY, at half-past 4 o'clock P.M., of CHOICE CUT FLOWERS. Further consignments of good bloom solicited. Good market empties and labels found. HOLLY, MISTLETO, and CHRISTMAS TREES wanted in the course of a few days.

T. B. JAMES holds SALES at his ROOMS every TUESDAY and THURSDAY, at half-past 11 o'clock A.M., of BULBS, STOVE and GREENHOUSE PLANTS, PLANTS from BELGIUM, GENERAL NURSERY STOCK, &c. Bankers, London and Midland, Birmingham.

To Market Gardeners. TO BE LET, 50 Acres of good LAND, Small House, and suitable Buildings.—Apply by letter, to D. C. THOMPSON, Esq., Squirrel Heath, near Romford, Essex.

JANNOCH (Lily of the Valley Grower by special appointment to H.R.H. the Prince of Wales), Dersingham, King's Lynn, Norfolk.

TWO NEW LATE GRAPES OF EXCEPTIONAL MERIT.

WM. CUTBUSH & SON

Have pleasure in offering the two following NEW LATE GRAPES raised by Mr. Myles, gardener to Lady Hutt, Appley Towers, Ryde, Isle of Wight, the whole Stock of which they have required. Both varieties have been Certificated by the Royal Horticultural Society.

LADY HUTT, a white Grape, raised from seed saved from Black Alicante and Gros Colmar. Bunches of medium-size, rather long and tapering. The berries are of medium-size, round, and of a pleasing amber colour. The flavour is exceedingly rich and sprightly, and is excellent for a late winter Grape.

Strong Planting Canes, 21s. each.

For further particulars, see the *Gardeners' Chronicle*, February 7, 1891, p. 173; the *Gardeners' Magazine*, January 24, 1891, p. 52; February 21, 1891, p. 105; *The Garden*, January 25, 1890, p. 87; December 13, 1890, p. 761; *The Journal of Horticulture*, October 24, 1889, p. 261. Also Special Circular, with leading Grape-grower's opinions, may be had, post-free, on application.

APPLEY TOWERS, a black Grape, also raised from seed saved from Black Alicante and Gros Colmar. The bunch is very much like that of Alicante. The colour is deep black, and when grown it is a point of some importance that there is no difficulty as to its colouring. It is far superior to Gros Colmar in flavour—in this respect there is a wide difference between them.

Strong Planting Canes, 21s. each.

 WOKING NURSERY, SURREY,

INVITE INSPECTION OF THE FOLLOWING WELL-GROWN
 STOCK:—

FRUIT TREES.—A fine stock of Apples, Pears,
 Plums, and Damsons, in Standard, Pyramid, and Dwarf-
 trained trees; also Dwarf-trained Apricots, Peaches, and
 Nectarines.

ROSES.—A large Collection of Dwarf and
 Standard Hybrid Perpetual and Tea Roses, in all the lead-
 ing varieties; also Tea Roses, in pots, for forcing.

RHODODENDRONS.—Choice named varieties
 set with flower-buds; also Hybrid Seedlings and Ponticums.

CONIFERS.—Fine stuff, in various Sorts, for
 Lawn and Shrubby planting.

SHRUBS.—Ornamental and Flowering, adapted
 for Belts, Shrubberies, Screens, &c.

CLIMBERS.—Including their celebrated Cle-
 matis, suitable for Walls, Trellis-work, Rockwork, &c.

ORNAMENTAL TREES.—For Parks,
 Avenues, Streets, and Private Gardens.

FOREST TREES.—In large quantities, for
 Coverts, Woods, &c.

AILSA CRAIG

Has no equal for Exhibition Purposes, either shown as a Single Dish, or in a Collection of Vegetables. It is the—

Largest, Heaviest, Handsomest,

and most **Perfect** Onion in Commerce.

It produced the Heaviest and Finest-Finished Three Dozen Specimens ever recorded, viz.:—

34 lb., 28½ lb., and 25 lb. respectively.

IN consequence of the late disastrous season for the Ripening and Developing of Onion Seed, my Crops of Pedigree Stocks proved almost an entire failure; especially does this apply to AILSA CRAIG, THE LORD KEEPER, ROYAL JUBILEE, COCOA-NUT, and ADVANCER, of which I have only a Few Hundred Packets to offer, saved from the finest possible Prize Bulbs, which may be obtained genuine in my Sealed Packets, from most of the leading Houses. Those who desire to obtain these Celebrated Stocks, should apply at once to their Seedsman, or direct to my Establishment at Banbury, as last year, when the Seed was more plentiful, I had sold out almost before the Season began.

PEDIGREE ONIONS

	Per Packet.—s. d.
DEVERILL'S— AILSA CRAIG	2 6
DEVERILL'S— COCOA-NUT	2 6
DEVERILL'S— THE LORD KEEPER	2 6
DEVERILL'S— ROYAL JUBILEE	2 6
DEVERILL'S— ADVANCER	2 6
DEVERILL'S— ANGLO-SPANISH 1s. 6d. & 2 6	
DEVERILL'S— ROUSHAM PARK HERO— 1s. 0d. & 1 6	
DEVERILL'S— IMPROVED WROXTON— 1s. 0d. & 1 6	

A description of the above varieties, as also particulars of the Gold Medal and other valuable Prizes to be awarded at Banbury, in Sept., 1892, will be found in my New SEED CATALOGUE, which will be ready in a few days, and forwarded to all applicants post-free.

H. DEVERILL,
SEED GROWER,
ROYAL SEED STORES,
BANBURY.

CANNELL'S Kentish Perfect Golden Seeds

ARE CERTAINLY THE BEST SAVED AND SOLD IN ENGLAND.

Why? All our own growing, therefore true! On the best spot in Europe, and by the most expert hands, and who have an interest in the business. They are consequently cheaper; and many of our strains not touched by any other firm. As an instance—

THE COUNTY GENTLEMAN, *February 14, 1891*, says of our PRIMULAS shown at a meeting of the Royal Horticultural Society:—

"They were so luxurious in their growth and blooming that it was difficult to believe they have relationship with those we are so accustomed to see. They received the highest award."

OUR INVALUABLE GRAND NEW PEA. CANNELL'S ENGLISH WONDER PEA.

Which certainly does away with all other first and second early kinds now in use, and should be sown at once. So surprised and satisfied was one of our most noted growers, that he sowed it early in the autumn, and is now in full growth under glass, and is counting on picking at Christmas or soon after. Many gardeners who have frequently seen this variety growing with us, are of a strong opinion that it will drive nearly if not all other Peas out of the garden. Testimonials from the following surely must go far to convince all of the wonderful prospect of this Pea.

The above now ready for delivery. Per Quart, 3s.

THE GARDEN, *September 19, 1891.*

CANNELL'S "ENGLISH WONDER" PEA.—This is a valuable early dwarf Pea, some 16 inches in height, which has received the above name. The pods are freely borne, are long and narrow, and contain from nine to eleven Peas very closely set, of a dark green colour and of capital quality. I saw it growing at the Eynsford Seed Farm the other day, being tested for late work also, and it answered admirably. These very dwarf Peas are out of character when staked; they should be sown in rows 20 inches apart, when, as in this case, they crop profusely. Frequent gatherings of such Peas as these in September would prove invaluable to gardeners whose vegetable requirements are heavy.

JOURNAL OF HORTICULTURE, *July 30, 1891.*

MR. E. MOLYNEUX.—For some years I have depended upon AMERICAN WONDER for supplying us with the first Green Peas, because of its good quality, though some other varieties are a few days earlier, and earliness is the first consideration with some people. This year I have given CANNELL'S ENGLISH WONDER a trial alongside the old favourite. The result is, I find the new variety superior to the old one in every respect. The growth is similar, but the pods are larger, and the Peas superior in quality. The two sorts were sown February 13, and gathered June 23. They suffered much by a frost on Whit-Monday, or would have been ready a week sooner.

MR. W. BAINES, *South Clifton, Newark.*

ENGLISH WONDER PEAS are in every way a success, abundance of crop, well filled, delicious in flavour. The AMERICAN WONDER cannot put a patch upon them; in a word, they are unrivalled, taking them all round as an early Pea. I have tried them in three different kinds of soil, and they seem at home anywhere—strong clay, strong soil, light sand.

MR. W. E. CORDEN, *W. R. Depot, Wakefield.*

The ENGLISH WONDER PEA I got from you this last spring, I consider it far in advance of AMERICAN WONDER—larger pods, and better filled, and a splendid cropper.

MR. W. A. COOK, *The Gardens, Compton Bassett.*

ENGLISH WONDER PEA is an excellent cropper, very dwarf and early, large pods, and of excellent flavour; it is a long way ahead of AMERICAN WONDER, WILLIAM THE FIRST, &c. It will become a most valuable variety for early work, either in pots or open border. I had a few pots, and was more than satisfied with result.

MR. JAS. DOUGLAS, *Great Gearies Gardens, Ilford.*

Your dwarf Pea ENGLISH WONDER is much superior to its American namesake, and a great rival to CHELSEA GEM. It is quite distinct from either. I gave it a fair trial between the two.

MR. T. PARKER, *Town Bank Road, Ulverstone.*

ENGLISH WONDER PEA I had from you is really a grand Pea—nice short growth, with well-filled pods; a delicious Pea.

MR. G. WYTHES, *Syon Gardens, Brentford.*

ENGLISH WONDER PEA is excellent in every way, and should be grown by all requiring an early Pea and a large cropper. Sown a fortnight later than AMERICAN WONDER, it came in first, and, what is better, it produced double the quantity, bearing longer, with large pods. It is a distinct advance, and should find great favour as a first early, and for gardens where room is valuable it should be largely grown.

OUR NEW CATALOGUE OF SEEDS will be posted free to all customers and applicants next week. It will be found the most practical, consequently, the most invaluable, to all connected with the Garden. As bad as the harvesting has been, and as bad as the Seeds must be this season, ours will be found in lovely condition, and quite justify our Trade Mark—"PERFECT GOLDEN SEEDS."

H. CANNELL & SONS, SWANLEY, KENT.

SANDER'S GREAT SALE OF ORCHIDS. THE LAST AUCTION SALE OF THE YEAR.

On FRIDAY, DECEMBER 18, at

PROTHEROE & MORRIS,
67 & 68, CHEAPSIDE, LONDON, E.C.

Another importation of Lindley's Old Labiata, from far beyond Swainson's hunting-grounds, and from a much higher elevation. Also,

**The Old Labiata, established and semi-established,
The Old Labiata in sheath.**

NEW CATTLEYAS, NEW PHAJUS, NEW SPATHIOGLOTTIS.

GARDNERS' LABIATA,

Semi-established, unflowered, grand plants. Every plant will be offered. Collected by the late Mr. W. DUNCE, fifteen days before his death from yellow fever. This is an early Autumn-flowering Labiata, very free, and second to none in beauty.

NOT TO BE CONFOUNDED WITH ANY OTHER LABIATA.

NEW and RARE MASDEVALLIAS,
NEW and RARE DENDROBIUMS,
NEW and RARE EPIDENDRUMS,
NEW and RARE CYMBIDIUMS.

SPLENDID SPECIMEN CYPRIPEDIUMS,
SPLENDID NEW HYBRID CYPRIPEDIUMS,
SPLENDID and CHOICE CYPRIPEDIUMS,
IN GREAT VARIETY.

**COOL ORCHIDS, in bud and bloom,
WARM ORCHIDS, in bud and bloom.**

MR. F. SANDER will also include in this Sale a magnificent lot of splendidly-grown CYPRIPEDIUMS, the property of a gentleman giving up the cultivation of these plants.

Grand Specimens of the following will be included:—

CYPRIPEDIUM MORGANIE,	CYPRIPEDIUM CARDINALE,
" SEDENI PORPHYREUM,	" SCHLIMM,
" BOXALLII,	" DORIS,
" DAUTHIERII,	" SCHOMBURGKIANUM,
" NITIDISSIMUM,	" ROTHSCHILDIANUM,
" CARICINUM,	" SUPERBIENS,
" ELLIOTIANUM,	" VILLOSUM,
" HARRISIANUM,	" HIRSUTISSIMUM,
" SPICERIANUM,	" HAYNALDIANUM,
" WEIDLICHIANUM,	" CONCOLOR,

And a great many fine Plants of other varieties.

SANDER & CO., ST. ALBANS.

THE Gardeners' Chronicle.

SATURDAY, DECEMBER 12, 1891.

MINLEY MANOR.

[SEE SUPPLEMENTARY ILLUSTRATION AND PLAN.]

NEAR to Farnborough and Aldershot, the one famous for its camp, the other as the residence of the Empress Eugénie, lies the estate of B. W. Currie, Esq. The place-names above-mentioned convey but little information to the gardener or landscape architect, but the mention of Bagshot sand at once conveys to him an idea of the configuration of the land, the nature of the soil, and the characteristics of its natural vegetation. It conjures up a vision of wide-stretching heaths, undulating ground, low rounded hills, plantations of Scotch Pines, which have so thriven that seedlings come up in all directions under the shelter of the heather and the gorse. The botanist knows exactly what plants he is likely to find—the gardener makes significant inquiry as to the depth from the surface of the iron "pan," and as to the difficulty of breaking it up. The only thing that strikes the visitor as peculiar are the fine Beeches, trees which one does not, as a rule, associate with such conditions as those mentioned; but here they are, and their bronzed leaves in early winter contrast finely with the blue-green of the Pines, and assort well with the rich gold of the Birches.

Minley Manor is a modern red-brick mansion with stone dressings, in the French renaissance style, with quaint "tourelles" and steeply-pitched pyramidal roofs, a sort of hybrid between Gothic proper and Jacobean. The main entrance is through a courtyard adorned with a central ornamental tower, which serves to diffuse the beams of the electric light. Ranged around this courtyard, are a number of fine standard Bays in tubs—specimens worthy of Belgium or Italy, but which are rarely seen so fine in this country. In winter they are housed in a fine orangery adjacent. Looking from the courtyard into the grounds, the view includes a long grass avenue, with two stately Douglas Firs as *avant-courriers*, and thereafter Wellingtonias and Limes in alternate sequence all down the line. The Wellingtonias have thriven, and the effect is imposing.

Passing through an archway in the courtyard, the visitor enters a cloister, recalling those attached to so many Italian monasteries, and from here the visitor gets his first glimpse of the sunk winter garden, constructed by Messrs. Veitch, and of which we give a plan (fig. 104). The form is a parallelogram, the dimensions—see scale to plan. The groundwork is formed of dark Yews, edged with white Euonymus

radicans. No fewer than eighty thousand seedling Yews were employed, and their dark foliage serves to set off to advantage the scrolls and devices, which are worked out in gold and silver Retinosporas (*R. plumosa aurea* and *R. squarrosa*). The symmetry of these little shrubs is admirable, so much so, that we were surprised that it is only found necessary to go over the beds once or twice in the year to secure the desired evenness of surface and clearness of outline.

Other portions of the design represent the family coats-of-arms and the monograms of Mr. and Mrs. Currie. Mound-like beds, arranged in panels of Golden Queen Holly, alternating with Hodgen's Holly, lend brightness, without glare, to the scene, even in the dullest winter day, whilst at night they are made to gleam in the rays of the electric light. These beds are constructed entirely of evergreen shrubs, so as to secure a pleasant outlook even in winter. They might be supplemented by similar beds on the terrace of Heaths, Pernettyas, Daphnes, interspersed with bulbs, or alternating with masses of bedding Pansies, *Silene pendula*, *Myosotis*, Wallflower, and other spring-flowering plants.

Some of our readers may throw up their hands at this reversion to a style of gardening which has not only gone out of fashion, but entails vigorously-expressed disapproval on the part of some critics. *De gustibus non est disputandum*. In this case, most visitors would, we think, agree that the work is in thorough harmony with the surroundings, and that the design, usually the feeble part in such undertakings, has been well carried out by Messrs. Veitch. It is not an excrescence from, or even an adjunct to, the house, but it is so contrived as to form, with the terrace garden, an integral part of the general scheme of architectural decoration. As such, it would, we expect, meet the approval of such a critic as the late J. D. Sedding, whose work on garden craft we had lately occasion to notice.

Beyond this scroll-garden, linking it to the wild woodland in the distance, Messrs. Veitch are contriving a garden which will be full of interest at all seasons. It consists of a series of bold beds, separated by grass, and devoted each to one description of herbaceous plant, or of flowering shrub. Clumps of herbaceous plants, interspersed with Daffodils and other bulbs, beds of Roses and double-flowering Brambles, of coral-barked Cornus, of golden-rinded Willow, of *Berberis stenophylla* and *B. Darwinii*, of white Broom and yellow Broom and orange Broom, of purple-leaved *Rhus* and golden-leaved *Weigela*, of *Clematis*, and further off of *Rhododendrons* and *Azaleas*, of—well of any and everything that is choice, beautiful, and fitting. No fear of monotony in such a garden, no meaningless wiggles, waggles and purposeless meanderings, but a system of arrangement similar to that which at one time conferred such a charm on the Oxford Botanic Garden without impairing its efficiency for educational purposes, but which is a thing of the past. Beyond this space, called the Plain, we come to the woods with glorious vistas of the distant country seen through the Pines. Massive Douglas Firs, stately Low's Firs, columnar Libocedrus, glaucous *Nobilis*, and many other of the finer Conifers add majesty and variety to the scenery. The skillfully constructed roads and banks are lined with Heaths and *Gaultherias*, *Berberis*, and *Periwinkles*, whilst on to the grass verges have been successfully transported large specimen plants of various of the more effective of the Conifers.

The kitchen garden bears marks of skilled management, but, at this season, does not offer much for the chronicler to narrate. Two features, however, are unusual, viz., the growth of pyramidal Apples and Pears on broad grass verges, and the separation of the quarters by low hedges of *Ilex crenata*, *Osmanthus*, *Retinosporas*, and other shrubs rarely used for such purposes. The order and keeping of the whole establishment reflects credit on Mr. Profit and Mr. Tubb.

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM × COOKIANUM, *hyb. nat.**

This is the supposed hybrid *Odontoglossum* which was exhibited at the meeting of the Royal Horticultural Society on November 14 last, by M. C. Cook, Esq., of Kingston Hill, and which received an Award of Merit, subject to its being named or verified (*vide Report*, on p. 591 of these columns). It appears quite distinct from anything hitherto described, and therefore the above name is proposed for it. Mr. D. Callimore, the gardener, states that it was received as *O. blandum*, which, however, is very different. I believe it to be a natural hybrid, but feel a little doubtful about its parentage, though its characters suggest *O. triumphans* and *O. Sanderianum*. The influence of the former seems evident in the deep yellow sepals and petals with numerous chestnut blotches, while the lip is very similar to that of *O. Sanderianum* in every respect. It is just possible, however, that *O. blandum*, instead of the latter, may have been one of the parents. It is a very handsome form, the contrast between the colour of the lip and the other segments being very striking. *R. A. Rolfe*.

MORMODES PUNCTATUM, *Rolfe, n. sp.†*

This is a new *Mormodes*, which has recently flowered in the collection of M. Gustave Bral, of Mont St. Amand, Gand, Belgium. Its origin is not certainly known, but it is believed to have been bought at one of the London sale-rooms some seven or eight years ago. The materials to hand are a pseudobulb, leaf, and part of the raceme, with three flowers. The pseudobulb is $\frac{3}{4}$ inches long, but it is said to be the smallest on the plant, and the leaf is $\frac{9}{16}$ inches long by $\frac{1}{2}$ inches wide. The species is allied to *M. Wendlandi*, Rehb. f., but differs especially in its broader densely-spotted segments, and the shorter and less-acuminate lip. It is certainly attractive, and is the third novelty in *Mormodes* which has appeared during the last few months. *R. A. Rolfe, Herbarium, Kew*.

ROCKERIES.

I was much interested in the article signed "W. A. C.," York, published in a recent number of the *Gardeners' Chronicle*, and in which it is suggested that alpine plants may be well grown, and yet so planted as to have an artistic and tasteful effect. I have also perused the series of articles on this subject, written by my friend, Mr. Ewbank, and I am bound to acknowledge that, in several cases which have failed with me at Geneva, he has proved that his method of cultivation is more successful.

I cannot say that the "Alpinum" figured by him, and representing a part of his plantation at Ryde, is the *ne plus ultra* of beauty; for, from an aesthetic point of view, I much prefer the "Mont Blanc" form of rockery condemned by him, and recommended by "W. A. C." I believe that either system is bad if carried to excess. Here, at Geneva, where the dry and hot summer climate kills many of our most

* *Odontoglossum* × *Cookianum*, *hyb. nat.*—Flowers stellate. Sepals lanceolate, acuminate, $\frac{1}{2}$ inch long by 5 lines broad; deep yellow, with numerous smallish blotches of deep chestnut, which pass into lines at the extreme base. Petals similar, but a little shorter. Lip much like *O. Sanderianum* in shape, stalk 4 lines long, yellow, with a few light chestnut spots, blade subimbricate, abruptly and shortly acuminate, 1 inch long by 6 to 7 lines broad, white, with large bright chestnut blotch in front of the crest, and a few small spots near the margin; crest consisting of a pair of diverging acute teeth, each with a second obscure tooth near the base. Column 7 lines long, with a prominent rounded tooth on either margin near the base, wings oblong, $\frac{1}{2}$ line long, apex tridentate or tricuspidate.

† *Mormodes punctatum*, *n. sp.*—Pseudobulbs elongate, subfusiform. Leaves lanceolate, acute. Raceme erect, with several flowers. Bracts ovate-oblong, subobtusate, 4 lines long. Sepals suberect, oblong-lanceolate, acuminate, light yellowish-brown, densely speckled with very dark brown, $\frac{1}{2}$ inch long by 4 lines broad. Petals 6 lines broad, otherwise like sepals. Lip stalked, blade triangular, shortly and abruptly acuminate, sides reflexed or nearly revolute, lateral angles rounded; colour yellow, with numerous small chestnut spots. Column pale yellowish-white, densely and minutely spotted with light purple. Habitat unknown.

beautiful alpine treasures, the point now under discussion is perhaps of even greater importance that it is in England, where the damp atmosphere is so favourable to this flora.

The great rockeries styled "à la Mont Blanc" were recommended by me in my book on alpine plants, and before me by such authorities as Kerner, Bissier, &c. I have made such a construction in the alpine garden here, and I must say the results have not justified my expectations. So large a rockery required more plants to fill it than any other form, and I ended by naming it the cemetery. With the exception of purely saxatile species, which I planted in the cracks of the stones (*Saxifraga longifolia*, *Cotyledon*, *Iberis saxatilis*, *Helianthemum*, *Linaria pallida* and *L. hepaticifolia*, *Omphalodes*, *Lucilia*, *Campanula Elatine*, &c.), I cannot be congratulated on my Mont Blanc. From an artistic point of view—and this is the opinion of M. Ed. André of Paris, whose judgement and advice I value much—this mass of stones is too rocky, not sufficiently covered with verdure, there are too many stones, and the effect is hard. The same remark applies to the rockeries in the Jardin Boissier at Valleyres, at least to the new ones which are not yet well clothed with vegetation. So that this system is good for purely saxatile plants, but bad for others.

Mr. Ewbank's plan, however, answers capitally for most plants from mountain pastures (not alpine) and mountainous regions, and especially for all bulbs. I have never been able to grow bulbs on my large rockery, while it is not suited to plants from high elevations, or to those which are essentially saxatile. "W. A. C." of York is well qualified to judge of such matters, because in that city Messrs. Backhouse have an alpine garden, which seems to be (unfortunately, I have never seen it) managed in the right way, and where it is said that those gentlemen succeed in raising the most delicate alpine. I do not think that "H. E." wished, while condemning the Mont Blanc form of rockeries, to include in that sentence the system pursued in the Backhouse garden, which seems excellent, and exactly what I have been trying to introduce here. I have now some photographs of one of the most beautiful of alpine gardens, that belonging to Mr. Kitson, of Leeds. This garden consists of a series of very natural-looking little irregular terraces, while here and there a trickle of water runs over the turf in and out between the stones, and forms tiny lakes, where semi-aquatic and bog plants succeed admirably. This is the best system, that which imitates Nature, and is one which will, I am certain, be largely adopted in the future. For my part, I have great confidence in the plan of planting on walls, and, as I have already said, I consider this the only means of acclimatising in England the more tender alpine, such as *Androsace pubescens*, *Helvetica*, *Charpentieri imbricata*, *Campanula Raineri*, *Elatine*, *Allionii*, *Cenisia*, &c. For these species I do not consider the "H. E." system good, and I prefer little separate rock-pockets, and above all the wall plan. A certain number of other plants, such as *Dianthus glacialis* and *neglectus*, certain species of *Artemisia*, *Achillea*, *Campanula*, *Phyteumas*, &c., require to be raised above the surface of the ground by small pebbles, which help to maintain moisture around the roots, and keep the delicate foliage from rotting in consequence of contact with the earth. A rockery is necessary for these. There are others which are tufted and sarmatose, *Androsace lanuginosa* and *A. sarmatosa* for instance, or *Gypsophila repens* which require a rockwork in order to display their full beauty. Finally, there is the series of drought-loving or xerophile plants, which must be kept dry, and do not succeed under the conditions of "H. E.'s" system. And, again, from an artistic and naturalistic standpoint the "H. E." system cannot be recommended. Still, the method has something in its favour: it is well adapted for the garden of the collector or connoisseur who especially prides himself on his success with some particular species; and, again, it is especially suitable for the flora of sub-alpine pastures, and those which

are more numerous and even more brilliant, and come from the mountainous regions, such as Siberia, New Zealand, Canada, and the Straits of Magellan. Many of the plants will do well at Ryde—and here I put on one side the species which find in a warmer and more temperate climate than ours the necessary materials for their life and development. These plants should also succeed with us, but hitherto they have not. Clearly, the plan of forming great rockeries in one corner, and pyramids of stones, is defective, while the method which Mr. Ewbank recommends is excellent for the great number of perennial species which cannot, strictly speaking, be called alpine, but which are some of the most beautiful of the plants of the higher elevations. *H. Correvon, Geneva.*

WESTROP HOUSE, HIGH-WORTH, WILTS.

This is the property of Gerard Orby Sloper, Esq., and is situated on high ground in the historically interesting and important town of Highworth, about seven miles from Swindon. Husbandry occupies the attention of the chief part of the population of the district, as it has done for ages, although the marks of the culverin-shot in the masonry of the fine old church, and other indications of strife, show that the work must have been carried on under difficulties at times.

Westrop House is an old-fashioned comfortable building, where the art of gardening has been cared for a great length of time, as the great age of the climbers, with which it is clad, shows, *Bignonia radicans* having stems as thick as a man's arm; the Honey-suckles, yellow Banksian Rose, and Jasmines being proportionately stout. So well do these climbers flower, that the owner is enabled to boast that there is not one day in the year when he cannot find a flower on one or other of them. The gardens, too, are old, and as is usual in old gardens, they have some very uncommon and effective arrangements and combinations which the hand of Time has beautified.

Beside the house is a commodious and ornamental conservatory furnished with Palms, Dracenas, Ferns, Phormiums, &c., and passing out, a broad expanse of smooth lawn unbroken by flower-beds (bedding-out for summer effect is not attempted here) meets the eye, and here there are four Cedars of Lebanon of noble proportions and great age.

In different parts, we find a Rose garden, the children's garden, always a feature that is full of interest in an old place; and several plantations of herbaceous plants, flowering shrubs and bulbs, some of which Mr. Sloper brought from the Rocky Mountains; and some Algerian Lises, which are of special interest. Passing through a curious set of subterranean passages, we come to one of the prettiest features in the garden, called The Grove. This is a shady serpentine walk, artistically arranged and planted many years ago, as may be judged from one of the Laburnums, which has a 7-feet girth of trunk, rendering it a very pleasant and secluded spot, in which along the whole distance but a very short view can be had at any point. After passing the grotto and rockeries, however, the brow of the hill at the end is reached, and here a grand view across the valley, along which the silvery Thames winds, with the whole range of the Cotswold Hills beyond, and the beautiful and varied intervening scenery, comes into view. Here, on the brow of the hill close to the end of The Grove, Mr. Sloper says that whenever earth is removed to any depth, the skeletons of men of unusual stature, all laid one way, and each with a large stone on the breast, are found. It is conjectured that they are those of Danes who fell in some of the earlier wars which, owing to the strategical advantages offered by the ground, have raged so frequently around.

For the rest of the gardens, it may be said that there are two small gardens facing the house in which, under Mrs. Sloper's management, Roses, Iris

Kæmpferi, perennial Asters, Sunflowers, Pæonies, and other showy hardy plants are admirably cultivated, the lesser portion being arranged as a wild garden. There is also a very fine walled-in kitchen garden, in which fruits and vegetables are remarkably well grown.

THE ORCHID HOUSES.

These are of special interest, for although old-fashioned structures, a great number of Orchids, and especially cool Orchids, thrive in them with the greatest luxuriance. Foremost among these may be mentioned the *Cattleya Dowiana*, *C. D. aurea*, and the varieties of the *C. Warscewiczii* (*gigas*) generally, which form the leading feature in the plant-houses at Westrop House, and all of which plants grow rapidly and flower profusely. There are about sixty specimens of *Cattleya aurea*, many of which are still in flower, filling the house with their beauty and fragrance. Among them is a plant of a natural hybrid of the *C. Hardyana* section, but with the sepals and petals beautifully marbled and veined with rose-colour, while the lip is even more exquisitely veined

FIG. 100.—PLATYCERIUM ALCORNE.

with gold than is the typical *C. Hardyana*. These plants are grown on a stone shelf, in a lofty, warm, lean-to house, near to the highest point of the roof. Possibly they thrive in such a remarkable degree because they are not meddled with too much. Some of the plants of *C. gigas* have borne from twelve to eighteen flowers each, and must have been grand objects. In the same house on the bed beneath, a lot of *Cœlogyne cristata* is in grand order, and will in due time be covered with flowers, although the temperature is higher than most Orchid growers would like to afford these plants. The *Cypripedium*s also do well here.

In the adjoining lobby are some fine masses of *Lælia autumnalis* covered with buds, and a lot of well-grown *Lælia cinnabarina* and *L. harpophylla*, with some *Vandas* &c., and in a cooler house beyond, in flower, were some pretty scarlet *Sophranitis grandiflora*, *Cymbidium giganteum*, a lot of *Lælia anceps*, in bud; fine *Odontoglossum grande*, *Epidendrum paniculatum*, various *Oncidium*s, among which is the best form of *O. ornithorhynchum superbum* that we have seen.

FRUIT AND PLANT-HOUSES.

Most of these have either undergone or are undergoing renovation, and they comprised a long range divided into many compartments. The first is a Peach-house, with *Chrysanthemums* in it, the second Vines, Azaleas, *Eupatoriums*, &c.; the third, Vines and Camellias; the fourth, a viney, in which cool Orchids are not doing remarkably well; and the fifth, various greenhouse plants, and beyond that a large old Rose-house. Throughout the old garden there is ample evidence that those who manage it must have plenty to do, and that the owner gets much pleasure out of it. *J. O'B.*

BROAD HORN FERNS, OR PLATYCERIUMS.

Of striking appearance, sturdy in growth, and permanently effective, these ought to be represented in one or more forms in all warm greenhouses and stoves. The Elk's-horn species (fig. 100, *Platycerium alcorni*), introduced from New South Wales about the beginning of the nineteenth century, thrives well in the former structure. It is the commonest form and the cheapest, and has all the meritorious characteristics of the genus except size; but the variety named *Platycerium alcorni majus* is so great an improvement on it, as to almost bridge over the great difference existing between *P. alcorni* and the nobler *P. grande* (fig. 101). All the species have a peculiar way of attaching themselves to trees or blocks, protecting their root-stocks by broad sterile fronds, which cling close to the bark on all sides but the upper one, where the somewhat reflexed, imbricated crowns, spread somewhat, so as to prevent water from above finding its way to the roots beneath.

Even the cooler-growing forms are easily grown artificially upon pieces of hanging wood, though they require special treatment and attention to cause them to commence growing, and assume fine masses permanently. A thick, solid piece of wood such as is likely to last for some years, should be chosen for the purpose, as this is far preferable to virgin cork, &c., which so soon falls to decay.

The best way to fix young plants to the block, is as follows:—Prepare a solid piece of wood, in size about 10 inches long by 6 inches wide, and 2 inches thick, placing copper wire, firmly attached to one end, whereby it is ultimately to be hung. The young plant to be grown thereon should be fixed at the centre of the slab, but one inch below the middle. To fix it firmly in place and secure it there indefinitely, a small bolt of wood, an inch square, and 5 inches long, should be nailed across the width of the face to be furnished, 8 inches from the top, against which the base of the peat used can be fixed. Choose, next, two pieces of fibrous peat 5 inches long by 4 in width, and lay one firmly against the wood; place a little leaf-mould and a few lbs of charcoal thereon, and over it fix the other piece; then cut a slit centrally from the top of the latter piece of peat down to its centre only. Insert such roots as the plant has into the leaf-mould through the central slit. Fix the crown of the plant just within the slit, with the sterile fronds lying close against it; press the edges of the slit tightly together, holding the plant firmly in place, and beat the peat firmly together with a flat beater, until it forms a compact unity. Then bid it down as firmly as possible, with three or four cross-overs of copper wire springing from nails driven into the wood at the edges of the peat. When finished, lay the slab on its back in a convenient place, thoroughly soak the compost with water, then syringe it to wash off loose particles; let it lie for a day or two, then hang it up, and do not water it again until the whole has become somewhat dry, by which means all will bind more freely together, and the only future attention required for some years, will be proper watering with occasional syringing. Occasionally also, when such plants are thoroughly established, and during hot, dry summer weather periods, it will be necessary to plunge the whole block and roots

into a tub of water to afford the proper amount of moisture to the roots. All the species may, moreover, be made to grow permanently on artificial rockwork, and in pots, if properly elevated above the soil, and upon blocks or rough stones, &c. As regards the latter, when the plants become established they prosper, owing to the uniform amount of moisture. Though they all require a high, moist temperature when growing, to insure the formation of both sterile and fertile fronds of large, noble dimension, it is necessary to keep them somewhat dry during the midwinter season.

amongst hardy fruit, given, of course, reasonable accommodation, such as a fairly high wall and suitable soil. If the necessary means are at hand to protect the blossom until the fruit is safely set and commencing to swell, then, I think, the cultivator has but himself to blame for a deficiency in the fruit crop. Where failure occurs, neglect may be traced as the primary cause, either by allowing the trees to be overruled with insects, mildew, and such pests to which Peaches are subject, or to neglect in so crowding the shoots, that they are deprived of sunlight and air. Here, in Hampshire, Peaches are

that the same tree has not once missed giving us a full crop of fruit for the last eight years. I would not advocate the planting of early varieties, such as Waterloo, Alexander, or Hale's Early to grow against an east wall, but Grosse Mignonne, Dymond, Violette Hative, or Royal George may with safety be planted. Peach trees exposed to strong easterly winds are sure to be attacked in the spring with blister of the leaves, but of this I take little notice. It is surprising how quickly Peach trees grow out of an attack of blister when the sun gains power in the spring, and warmer nights are ex-

FIG. 101.—PLATYCIERIUM GRANDE. (SEE P. 697.)

Platycerium grande, the Moreton Bay species, is by far the most noble plant; the recently-introduced *P. Willmckii* (fig. 103, p. 701) is a noble form, having broad, roundish, deeply tuberculated, sterile fronds, some 5 or 6 inches across, and unusually erect, whilst the fertile ones are 2 to 3 feet in length. *P. bifurc.*, *P. Wallachi* (fig. 102 p. 699) and *P. Hillii* are also showy species deserving of being cultivated. *William Early*.

PEACHES ON OPEN WALLS.

In the south of England the out-door Peach crop may safely be regarded as one of the most certain

regarded as the most certain crop of out-door fruit we have, and although our convenience for cultivating them extensively does not admit of this, we manage to get a good lot of fruit. During the past season we had two trees of Walburton Admirable heavily laden with fruit, the flavour of which was but poor, however, owing to the wet, sunless weather. Still, these fruits were useful for cooking purposes, and for bottling they were appreciated.

It may surprise some persons to know that Peaches can be grown successfully on an east wall. One of the trees mentioned above has an eastern aspect; another, *Grosse Mignonne*, occupies part of an outside east wall, and considerably exposed to strong winds from that direction. I can say safely

perceived, and especially when some attention is paid to them in the way of gradually picking off defective leaves, syringing with tepid water, and removing heavy winter surface mulchings of manure to admit of the sun warming the soil, which does far more service than keeping them constantly covered. Mulchings of manure are very well in their proper place, but injudiciously applied they are calculated to do much more harm than good to fruit trees of all kinds, especially Peaches.

It is not necessary, either, to have high walls with expensive glass copings to ensure good crops of fruit although where these luxuries can be had, so much the better. Our wall is but 9 feet high, in some places less. It is furnished with but a 3-inch brick

coping, which is almost useless, because it is not wide enough to carry the drip clear of the leaves and fruit; in fact, it just provides the means of constantly keeping some parts of the trees wet. If the walls are low, the trees can be trained in a more horizontal fashion—increased size is then obtained for any particular tree which requires extension. One of our trees of Grosse Mignonne reaches 10 yards on a south wall, and carries annually over one hundred fruits, which never fail to colour splendidly. The soil here is a heavy one; and, with the addition of old lime-rubble, wood-ashes, and by deep moving, will grow Peaches well. Soil of this kind does not need nearly the amount of attention in watering as does a light staple. Where many err in Peach culture is, in neglecting the roots of their trees after the fruit is gathered; if the weather be dry during September and October, the borders

it may naturally be assumed it is now solid. Judging by the appearance of the Peach trees, it will not be necessary to interfere with it yet for some time to come.

An important point to study in preparing the trees for next year's crop is the thinning out of the shoots directly the fruit is gathered, so that those remaining will have a better chance to ripen by receiving a greater share of sunlight. What is the use of deferring the pruning or thinning-out of useless wood until the spring, when the trees are rearranged on the wall, and too many branches are there for the space?

Trees managed in the way indicated, need little or no pruning in March. It is a good plan to take the trees from the wall every season, not only for retarding the blossom-buds, but also for the purpose of cleaning them where required.

less summer. Until the fruit has passed the stoning period, I do not find it is necessary to assist the trees at all with stimulating food. Should the weather be dry previous to that stage, copious supplies of clear water may be afforded; afterwards spread a thin mulching of horse-manure over the roots to retain moisture in the soil. Trees which are carrying a full crop of fruit may have assistance once or twice after the stoning period is past. I know nothing better than Wood's *Le Fruitier*, which not only induces the tree to grow vigorously, putting a healthy colour in the leaves if they have previously appeared sickly. It should be sprinkled on the soil thinly, lightening up the soil with a fork afterwards, but not turning it over. A good soaking of clear water should then be applied to the surface to wash in the manure about the roots. Although this stimulant quickly changes the "tone" of the trees, it does not induce a strong sappy growth. Where the drainage is perfect, Peaches cannot have too much water during hot and dry weather, either at the root or overhead.

In addition to the sorts named, Bellegarde and Barrington are reliable croppers and the fruit of good quality. Some of the early varieties are valuable only in that respect, they being far too "woolly" to be appreciated. It is much better to grow two trees of an approved kind than to plant others merely for the sake of variety. By arranging the same kinds against walls of various aspects, a succession may be kept up with one kind, as well as by many, and with much more satisfaction when the fruit finds its way to the dessert table. I omitted to say that walls with a western aspect will also grow good Peaches.

Disbudding I have not referred to. It is important, but it is not attended to in the early stages of growth, as it should be. Directly the shoots are large enough to handle, a few ought to be removed at a time—a plan that does not check the growth at all, those growths which spring from the direct front of the branches, as well as those which grow from the underneath side. Shoots which promise to be misplaced ought to be rubbed off early to give space to the remaining growths, that the latter may grow strong from the commencement. E. M.

NURSERY NOTES.

ORCHIDS AT MR. WM. BULL'S.

It is with justifiable pride that Mr. Bull points to his fine collection of old-established plants of *Odontoglossum crispum* and *O. Pescatorei*, and his superbly healthy stock of *Miltonia vexillaria*, as examples of good culture in the smoky metropolis, which growers in the most salubrious country-districts cannot excel. The beauties of these flowers naturally appear to the greatest advantage at this almost flowerless season of the year, and a recent visit revealed a fine display in the cool *Odontoglossum*-houses, where along the whole length of the house the fine spikes of *Odontoglossum crispum* border the middle walk on either side. Many there are of the unspotted forms which are of perfect shape, and some are pure white, and some tinged with blush or rose. Among the spotted forms are several varieties of *O. c. guttatum*, one of them with large brownish blotches of the *O. c. Stevensii* class, while one has unspotted petals, but with six or seven dark blotches on each of the sepals. The whole of the plants in flower speak highly of the strain, and of the care displayed in selecting to grow on to such large plants. Also in flower are a few hybrid *Odontoglossums*, the *O. bellinum*, a heavily-spotted yellow variety, being an exquisite thing.

In the house devoted to *O. Pescatorei* there is an equally good show, the best form of that species now in bloom being *O. P. splendens*, in which the labellum is large, and showily decorated with purple blotches. Here the *Oncidium macranthum* are in fine condition,

FIG. 102.—PLATYCERIUM WALLICHII. (SEE P. 638.)

near the wall should receive a thorough soaking. It is surprising what a quantity of moisture a brick wall will absorb from the soil, and this must be at the expense of the Peach tree roots.

Another mistake is that of digging the surface of the border in which the trees grow. Peaches like a firm soil, and as long as the trees flourish in it, the roots should not be disturbed. It is necessary, perhaps, to lift a young tree, and replant it in the same place, or to cut a trench around it at a distance from its stem base, with a view to check luxuriant growth, and induce fruitfulness; but beyond that do not interfere with the roots at all. The border in front of our Peach trees is occupied with herbaceous plants. A path, 4 feet wide, directly in front of the trees, is left for the convenience of attending to the plants in the border and the Peach trees, as well as allowing light to reach the trees; consequently, this space receives ample treading, and as the soil here has not been disturbed for ten years,

Insects, such as green and black-fly, are too often neglected during their earlier stages—it is useless to wait to see two aphides of either kind—adopt a remedy upon seeing the first. Vigorous syringings with clear water will dislodge the former, and tobacco-powder dusted over the other at night. In the morning, give the branches affected a thorough washing with the garden-engine or syringe, to clear off both fly and powder alike. When the nights are warmer, say, during May, the trees will be all the better if syringed with tepid water every other day, and through the hottest parts of the summer a thorough drenching of the trees every evening will be of much service in keeping down red-spider. The water, too, will cool the wall for the night, giving a more healthy tone to the trees.

In heavy soil Peaches require but a small amount of stimulus, or they will have a tendency to grow too luxuriantly, which often results in gummed branches, when a severe winter follows a wet, sun-

and well-furnished with spikes, and *O. Phalænopsis*, *Odontoglossum crocidipterum*, and small batches of *O. Rossi majus*, *O. Erstedii*, some *Promenæas*, and others of the neat-growing Orchids are in bloom. The *Cattleyas* and *Lælias* in the large intermediate-house are in splendid condition, the *Lælia purpurata* and all the other showy species being densely set with flower-sheaths. At present there are only the varieties of autumn-flowering *C. lutea*, and a plant or so of *C. maxima* in bloom; but in the lesser house, filled with *Lælia anceps*, *L. autumnalis*, &c., there is a good show of their bright flowers from end to end. *Lælia anceps rubra* is a fine thing of the *L. a. grandiflora* section, and others of the named varieties display qualities which excuse their being distinguished. Arranged in this cool-house with the *Lælias* are a great profusion of *Oncidium varicosum*, *O. tigrinum*, *O. unguiculatum*, and *O. pretectum*, *Odontoglossum grande*, *O. Lasleyleopardinum*, and the sweet odour of the *Trichosma suavis* betrays the presence of a batch of that pretty plant in bloom even although they are arranged at the extreme end of the house. Another house has a very pretty group of the best varieties of *Lycaste Skinnerii alba*, arranged with the blue *Tillandsia Lindenii*, and a few Orchids; and in the adjoining warm-house is a bright display of *Calanthes*, the colour being supplied by many spikes of *C. Veitchii*; but of this species also, there were plants of the pure white, one in bloom, and also the white form of *Dendrobium purpureum*. In another cool-house, a pretty group of the scarlet *Sophranites* was arranged, some of the plants having a dozen or so blooms of good size and very bright colour. With these, are plants of the finely fragrant *Pilumna nobilis*, a plant or two in flower of *Odontoglossum aspersum*, and of the handsome *Epidendrum Wallisii*. In one of the other structures was a group of *Dendrobium formosum giganteum*, *Odontoglossum Rozzii*, and the pretty *Oncidium cheiroporum*. The *Lycaste*-house had a few bright coloured *L. Skinnerii*, and the pretty light-coloured *L. S. bella*, and with them a lot of *Odontoglossum maculatum*, of which *O. m. erosum* is a very dark richly-coloured form. Here also were plants in flower of *Ceologyne barbata*, *Ada acranthica*, &c.

The large *Cypripedium*-house has been thoroughly renewed and rearranged, and well do the plants seem to appreciate the change. The rare and handsome *C. Saundersianum* × has just finished its handsome white and purplish-crimson flowers for this year, but still there remains the pretty *C. Sallierii* ×, *C. Seegerianum* ×, *C. conchitum* ×, *C. Schlimii*, *C. selligerum majus* ×, *C. Dautherii* ×, *C. Ainsworthii* ×, *C. Ashburtonia* ×, *C. Lecanum superbum*, *C. Dayanum*, and batches in flower of *C. Lawrenceanum*, *C. callosum*, *C. barbatum Warnerii*, and the varieties of *C. insigne*, most of which were collected by Mr. Freeman for Mr. Ball. That named *C. i. Freemanii* is a very distinct pale form, in which the spotting is of a soft tint o brown, and over the whole flower there is a yellow glow. *C. i. pictum* is a dark, heavily-spotted form; and *C. i. maculatum*, one in the dorsal sepal of which there are only a few large brown blotches and above them two or three purple ones. In other houses were some *Phalænopsis* in bloom, also *Dendrobium McCarthiae*, *Cymbidium elegans*, *C. Mastersii*, *Catasetum pictum*, *C. secatum*, *Bulbophyllum umbellatum*, &c.; and a noble bark of *Vandas*, and another of *Ceologyne cristata* and *C. c. alba*, and in one of the greenhouses a fine show of winter-flowering *Carnations*.

FORESTRY.

FORESTRY IN FRANCE.

A RECENT issue of *Le Temps* contains an interesting article on forestry and the timber industry in France, of which we give the following résumé:—M. Boucart, the prominent protector of our forests, to whom Sologne owes the restitution of her forest

riches destroyed during the winter 1879 80, has published a very interesting brochure upon the falling-off in value of our forests. We shall not follow the author in his economical conclusions, but merely point out that M. Boucart considers the chief causes of the decadence in value of the forests to be the steadily growing use of coals for burning, and of iron for buildings as well as ships. The area of French forests is 9 185 000 hectares, or one-seventh of the whole country; and whereas, M. Boucart informs us, the timber production prior to 1881 was valued at 32 million francs, it fell in 1881-85 to 24 millions, and last year did not exceed 21 millions. In the eastern parts the falling-off in the value of the output has been between 30 and 40 per cent., and in the western even 50 per cent. In wood for the making of charcoal—once so largely used in France for smelting and domestic purposes—the decline is no less than 64 per cent. In the *Nievre* the price of wood fuel has fallen from 85 francs to 60 francs per 10 cubic metres, and bark in bundles of 104 has declined from 180 to 140 francs, whilst staves for barrels have gone down from 500 to 350 francs per thousand. In central France, too, with its rich and old forests, their value has declined. Timber for the manufacture of wooden goods has also fallen in value, through competition from Scandinavia. Finally, in the *Pyrenees*, the value of the *Pine* forests is less by 40 per cent. than ten years ago. As regards the ownership of the French forests, we learn that 967,118 hectares belong to the state, 2 090 788 to communes and public bodies, and 6 127 398 to private persons. To the state alone there is at present a falling off in revenue of about 11 millions francs annually, and M. Boucart estimates the total falling-off at 81 million francs, as the imports of foreign wooden goods have risen from 15 million francs in 1850 to 160 millions at present, one year showing even 278 millions. In order to arrest this decline, M. Boucart suggests, firstly, increase of duties on wooden goods, and secondly, as there is but little demand for charcoal, the introduction of trees producing essences, acids, alcoholic substances, tar, wood pulp, &c. In conclusion, the writer advocates the mechanical method for sawing the timber, and the formation of syndicates of forest owners, with a view to a more economical way of production and limit of out-turn.

COVERT PLANTS.

IN the formation of plantations for ornament and utility, a proper selection of covert plants that will grow under the shade of trees, and afford shelter and food for game is a branch of forestry that requires the close attention of the planter. No doubt there are some of our best covert plants that do not, as a general rule, produce food for game; but there are some few species that do so, and are also highly ornamental, and we think, on that account, that their culture should be extended.

The Wood Laurel (*Gaultheria Shallon*) [This is the common name for *Daphne laureola*, as Aromatic Winter Green is of *Gaultheria Shallon*, *Ed.*] combines all these qualities; therefore, we can commend it to the notice of the planter with confidence. It is a pretty evergreen shrub, a native of North America, where it forms dense thickets beneath trees; and as it grows on a great variety of soils, including damp boggy ones, its extension on that account will be the easier. Its habit of growth is rather procumbent, but, in Ireland, it occasionally forms a dense bush some 5 feet high, well furnished with side branches in a uniform manner from the ground upwards, and as these are well clothed with its pretty dark-green glossy leaves, it is a conspicuous and an attractive plant at all seasons. In early summer it produces its pretty white flowers in terminal racemes, the reddish-coloured berries appearing in autumn, are often produced in great abundance, and become black when ripe. It is seldom, however, where birds and game are plentiful, that the berries are allowed to remain for any great length of time on the bushes, as they are highly relished by the feathered tribes.

When planting these shrubs in old plantations, the ground should be well broke up with a pick at the spots where the plants are to stand. If the soil has become exhausted by the roots of old trees, it will be found a good plan to add a little fresh soil or leaf-mould, mixing it well with the staple. These remarks apply to the culture of other kinds of covert plants as well. Amateurs living in the vicinity of large towns may plant this species, as I find it grows very well in smoky districts, and appears to be in good condition in Kelygrove Park, Glasgow, under the skilful culture of Mr. McLelland.

The prostrate *Gaultheria* (*G. procumbens*), as its name denotes, is a dwarf-creeping species from Virginia, and other parts of U.S.A., where it grows on dry sandy ground, as well as in the wooded parts of the country on the mountain ranges. In this country its habit is that of a flat-creeping shrub, clothed with obovate leaves of a dark green colour. It generally produces its white flowers about mid-summer, and its bright scarlet berries in autumn and early winter; and as these are highly relished by game, the planter should use it for covering banks of gravelly soil both in open places as well as beneath trees, where it appears to be quite at home. It is also well adapted for planting on bare rocky bluffs in the vicinity of water, and when once established in the crevices of the rocks, these soon present a furnished appearance.

This kind of planting, however, entails considerable care and painstaking on the part of the planter, and I have often found it necessary to introduce a small quantity of soil into the crevices, to encourage the plants at starting. Peat bog, or soft soil of a peaty texture, answers well for this purpose, as it attracts and retains moisture—a matter of vital importance on dry rocky places, and as it likewise promotes the formation of roots, the utility of using the stuff can be seen at a glance. When peaty soil cannot be had conveniently, a mixture of ordinary soil and leaf-mould may be substituted for it. In open places, *G. Shallon* may be planted on the shelves of the rocks in a similar manner, to show contrast and variety. *J. B. Webster.*

CHRYSANTHEMUM NOTES.

GROUPS OF PLANTS.—I have had to judge groups many times during the past season, and generally I have had to consider two things, viz., quality of the individual blooms, and taste in arrangement. I had to judge at one exhibition this year where about an equal number of groups were formed of naturally-grown plants and of cut-back examples, the plants being each furnished with three flowers. The exhibitor who has to depend upon plants with only three flowers on each is at a considerable disadvantage when competing against one who has equally good plants, but well furnished with fully-developed flowers, and buds in various stages of development. I had to solve this problem at an exhibition where the entire responsibility rested upon my shoulders, and as the two items had to be taken into consideration, I gave six points to each.

At the exhibition of the Cheshant Society, prizes were offered for groups of Pompons, the plants to be cultivated and flowered in 6-inch pots. This brought two collections of exceedingly well-grown plants. Nothing was said about single stems, and the exhibitors had placed from two to five plants in each 6-inch pot. The plants had been raised from cuttings planted in June, and had been pinched back once, and some of them twice. Scarcely anything could be better than these well-grown healthy plants for furnishing a small greenhouse.

There ought to be a general departure from the formal groups sloping from back to front. At the Brighton exhibition they manage their groups very differently, the whole face of the groups being irregularly broken up. If a photograph of one of the best of these Brighton groups could be obtained and published, it might be the means of letting in some light upon the subject. *J. Douglas.*

FOREIGN CORRESPONDENCE.

BERLIN LETTER.

THE great attraction lately has been the Chrysanthemum exhibition in the Kaiserhof. Chrysanthemums have been cultivated in Berlin for many years, but there were only the little and medium-sized flowering varieties in cultivation, and of these only white ones. Chrysanthemums had and have

few years German Chrysanthemum culture will rival that of the English. Moreover, German nurserymen will try to raise new varieties. Now, English Chrysanthemum growers, especially Messrs. Reid & Bornemann, of Sydenham, and Messrs. Pitcher & Manda, of Hextable, Swanley, Kent, are the chief importers of Chrysanthemums into Germany. They had very fine collections here of cut flowers, whose names are, I think, well known to your English readers, so that I need not mention them.

It may be of more interest for you to learn in

of cultivation is to make a frame of wire, and to bind up the twigs upon this framework so that the plants have a head of about 2 or 3 feet in diameter, and only of 1 foot in height. These plants are so regularly covered with flowers that nothing can be seen of the foliage, and the whole almost resembles a dwarf but large-headed Azalea indica, with the difference that each flower is seen and has its full effect. There were about a dozen of such plants, which were much admired by the public. A fourth method, and, as it seems to me, the only one which has a future here in Germany, is to raise cuttings when the flower-heads are already formed but not yet prominent, and put them in pots of about 3 inches in diameter to root and flower. These plants are of about 1 foot high, and each is furnished with one well-formed large flower-head. Certainly such plants will be purchased here in large quantities if the price be moderate. The German public does not spend much money on a plant—one or two shillings, that is more than enough. Lastly, there is the method adopted when medium-sized flowers are required, to form a stem of about 2 feet high, with a crown of some 3 or 4 feet in diameter surmounting it. These plants have a good effect by reason of the large mass of flowers. As to the prizes, Messrs. Reid & Bornemann gained a Gold Medal; Messrs. Pitcher & Manda, a large Silver one.

Allow me to make some remarks concerning cut flowers at exhibitions. Of course cut flowers were shown in large collections, and during the first two days they were in general in good condition, though already on the first day some of them began to droop. Now, there is such a simple mode of keeping flowers fresh for a week at least, that I wonder that it is not used. This mode is to place the flower-stalk in water, so that no air comes to the cut part. Or, even when out in air, it generally suffices to cut the stalk about 1 or 2 inches above the first cut. When this operation is repeated, a flower remains strong for more than a week.

Perhaps it may also be interesting for you to learn that at Berlin, on November 3, a school for gardeners was established by the magistrates of the city and the two horticultural societies. There are two classes. In the lower one, all those who have had only the education afforded by an elementary school, are taught German, science of plant life, and drawing; whilst in the upper one, gardeners with a higher education learn general plant culture, the science of soil and manures, bookkeeping, and drawing. The course is from the beginning of November to the end of February. Lectures are given twice a week—in the evening from seven till nine, and on Sunday from nine till twelve. The fee is for each pupil for the whole winter, 3s. At first, there were about thirty-five in each class, but the number is fast increasing. I may mention that each pupil got an entrance-card for the Chrysanthemum exhibition. Dr. Uro Dammer, Friedenau, Berlin.

CUNONIA CAPENSIS.

As showing the free-flowering tendency of *C. capensis*, I may mention that our plant, which is a tall-headed standard on a 6 feet stem in a tub, and which is placed out of doors throughout the summer, has at the present moment upwards of 300 pairs of flowers on it. I had no idea till this season that it was such a free-growing and free-flowering plant. Why plants of this description are allowed to remain in obscurity is not very well explained, unless it be that it has never been put in a commercial catalogue. H. K. Lucken.

ORCHID NOTES AND GLEANINGS.

FERTILISATION OF CYPRIPEDIUMS.

A STRIKING illustration as to the way in which Cypripedium flowers are fertilised by insects came under my observation not long ago, which bears upon, and somewhat strengthens the opinions of the late Mr. Charles Darwin and Professor Asa Gray, as to the manner in which cross-fertilisation is accom-

FIG. 103.—PLATYCERIUM WILLINCKII. (SEE P. 635.)

A, Sporangia; B, Stellate hairs and spores from back of leaf; C, Stellate hair from surface of leaf.

here a special use on the last Sunday in November (All Souls' Day); they are the flowers of the dead. It is not longer ago than three or four years since the large-flowered varieties began to be cultivated, and hardly anywhere has any plant gained in so short a time such a large number of amateurs. Indeed, Chrysanthemums are now the fashionable flowers here. German gardeners are still only cultivators of this plant, for they are still importing cuttings and growing them on. This exhibition showed that they are well able to grow them excellently, and that if good cultivation continues, in a

what manner the plants are cultivated. There is in the first place, the true English manner: i.e., by using large pots, and plants with one or a few stems, each ending in a single flower-head. This manner is not admired, the German public wishing to see in such large pots more than three or four or even fewer flowers. Another mode of culture is to raise large bushes of some 4 or 5 feet in diameter, with a large mass of flowers. There were in this exhibition several collections of plants of this form, which were in the best condition, the plants being in full flower, and the leaves reached down to the pots. A third mode

plished in this genus. The former gentleman at one time supposed that insects removed the pollen by way of inserting their probosces through either of the orifices close to the anther, which he artificially accomplished by means of a bristle inserted in a manner, as he conjectured, similar to the way an insect would perform the task, though he acknowledged that the important and essential feat of leaving the pollen on the stigma was not so well effected.

In the case noted above, a fly rather larger than an ordinary house-fly had doubtless entered the labellum, by way of the larger opening, for some reason or other, and in making its exit was passing up one of the orifices, but being of too bulky dimensions, it had become wedged so tightly as to be unable to proceed either backwards or forwards; this caused its death, but not without removing the pollen which was adhering to its back.

Mr. Darwin, in his book on *Fertilisation of Orchids*, writes:—"After the publication of my book, Professor Asa Gray wrote to me that he was convinced from an examination of several American species, that the flowers were fertilised by small insects entering the labellum through the large opening on the upper surface, and crawling out by one of the two orifices close to the anthers and stigma. Accordingly, I first introduced some flies into the labellum of *C. pubescens* through the large upper opening, but they were either too large or too stupid, and did not crawl out properly. I then caught and placed within the labellum a very small bee, which seemed of about the right size, namely, *Andrena parvula*, and this by strange chance proved, as we shall presently see, to belong to the genus on which in a state of Nature the fertilisation of *C. calceolus* depends. The bee vainly endeavoured to crawl out again the same way by which it had entered, but always fell backwards, owing to the margins being inflected." After several attempts it "ultimately forced its way out through one of the small orifices close to one of the anthers, and was found when caught to be smeared with glutinous pollen. I then put the same bee back into the labellum; and again it crawled out through one of the small orifices, always covered with pollen. I repeated the operation five times, always with the same result. I afterwards cut away the labellum, so as to examine the stigma, and found its whole surface covered with pollen. It should be noticed that an insect in making its escape must first brush past the stigma and afterwards one of the anthers—so that there will be a very good chance of cross-fertilisation between two distinct plants." The plant in the case mentioned by me was *C. barbatum*. *W. Harrow, Botanic Garden, Cambridge.*

CYPRIPEDIUM LAWRENCEANUM.

A flower of this species from the garden of Major-General Hutchinson, Outhope, Bournemouth, exhibits the fine character a very good form of it possesses. The dorsal sepal, which has more breadth than length, measures 3 inches across the upper part, while the surface is closely lined over with dark crimson, the lines at the base being of a bright green colour. The petals are 5 inches across.

ONCIDIUM KRAMERI.

Two noble flowers of this species also came from Outhope, and, as Mr. W. H. Jones, the gardener, suggests, they are fine varieties. Both are of bright yellow, richly mottled with brownish-red, darker in one than the other. The erect sepals are 2½ inches long, and the plants, in addition to being good varieties, have been well grown, and Kramer's Butterfly Orchid is not one of the easiest to cultivate.

FRUIT NOTE.

PLUMS.—Coe's Late Red is not without its merits. A pyramidal tree here had a crop of fruit, which, although the excessive wet caused many to crack, was of fairly good quality. They were gathered on November 1, and the last eaten on November 14. It reminds one of a late kind of (Reino Claude Violette) Purple Gage. *Will Taylor.*

TREES AND SHRUBS.

HYDRANGEA PANICULATA.

To increase this plant, take half-ripened cuttings, make them 3 to 4 inches long, and place them round the side of a 5-inch pot in sandy soil, and plunge the pot in a close case in a temperature of 60° to 65°. When rooted, take them out of the case, and stand them in a more airy position. It is a very important point not to allow the cuttings to flag before they are struck, or it will be a difficult job to get them round again; a slight watering afforded overhead occasionally, will revive them, but care must be taken not to do this too much, or damp will carry them off. The cases should have the moisture which has settled on the panes wiped off every day. Rooted cuttings may be potted into 60's, and kept in a cold frame, and by the time they are required for planting out, they will have made nice stuff. *H.*

THE CALIFORNIAN ALLSPICE (CALYCANTHUS OCCIDENTALIS).

Apart from the pleasant perfume which is possessed by the blossoms, the colour of the flower—bright brick-red—is uncommon amongst shrubs, especially at the time of year when this shrub flowers. The foliage, deep green in colour, forms an agreeable contrast to the bright-coloured flowers. *Propos* of transplanting this shrub, some care is needed when the plants are large, and especially if the soil be heavy and retentive; a peaty soil suits it best, and in this it is readily transplanted; but in the former, fibrous roots are sparingly made, hence the greater necessity of careful procedure, and good balls of earth removed with the whole of the roots. *E. M.*

COTONEASTER HORIZONTALIS.

Although this pretty and distinct species was introduced from China so recently as 1885, it seems as though it is destined to become one of the most popular of the Cotoneasters. In habit it is very distinct and neat, sending out flat branches almost horizontally, hence the appropriate name *horizontalis*, and in spring and summer these are clothed with small leaves of a rich green colour, which in the autumn turns to a bronzy-red; and it might be almost termed deciduous, for it loses the greater part of its foliage every winter, the only leaves remaining being those towards the end of the shoots. Its bright showy rosy-pink flowers are borne profusely; and if the flowering shoots are cut off and stood in water, the flowers will keep fresh for several days. Its berries, coloured vermilion, add greatly to the value of the shrub. The species is just now being propagated extensively in several nurseries. It is not fastidious in regard to soil, and seems to flourish even in those soils that are poor and sandy, and, being quite hardy, it was in no way injured by the severity of the past winter. It is a capital subject for the rockery, which is perhaps its proper place, although it may be used as an edging to beds of other shrubs, as is *C. microphylla*, or stood as a specimen on the lawn.

This species of Cotoneaster may be increased from seed, but the quickest way is to take slips in the first week in August, a time when the wood is getting firm, making these about 4 inches long, and dibbling them in light sandy soil round the sides of a 5-inch pot, and plunging them in a close frame with a temperature of 60°. When rooted, which will be in a few weeks, they must be stood in a cool, well-ventilated frame, and by the following spring they will have become nice little plants, fit for planting in the nursery. When planting, mix some leaf-mould with the soil about the roots, and afford a good watering to finish the operation. *H.*

WEeping DOUGLAS FIRS.

At Albury, Surrey, are several varieties of this noble Fir, with drooping branches. To give variety one may be desirable here and there, but the pendulous form is by no means so noble in appearance as the ordinary Douglas, of which there are several fine specimens in the grounds above-mentioned.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

FRUITING PINES.—At this season of short days and little sunbeats, it is important to have the roof-glass kept very clean in localities near smoky towns, or drawing of the leaves will occur. Where tree leaves are employed for bottom-heat, heaps should be thrown together to set up fermentation, and these should be turned over once or twice, so as to get them generally heated before adding them to the older materials in the beds. If the houses and the bottom-heat beds were rearranged about six weeks ago, the temperature will be easily managed, and the plants with advanced fruits can be accommodated with the needful warmth to finish their swelling. In the case of fruiterers, it is essential that an even temperature be maintained in the bed, a fluctuating one being productive of small or deformed fruits. The supply of moisture at the root, and in the air of the house, should be carefully afforded. A night temperature of 65°, with a rise of 10° during the day, is suitable at this season. If a covering be put over the glass at night, the evils of a parched air will be greatly lessened, and the growth favoured by the more genial conditions maintained. A few degrees higher temperature at night in mild weather will do no harm, but high temperatures during frosty nights result in mischief. These fruiterers ought to be kept well up to the glass, or the leaves will sensibly lengthen, and the crowns become large. Successions will require a temperature lower than that afforded the fruiterers, 60° by night, and 65° to 70° by day, the latter in mild weather, will be suitable ones. Remove any plants showing fruit to a warmer house, or the warmer end of the accession house. Pines in a cooler house at rest, previous to showing fruit, should not want for moisture. Aërial moisture is of great importance to these and the fruiterers, and the walls, floors, and beds should be damped daily, the plants being thereby kept steadily growing. Overhead syringing should be dispensed with at this period of the year, and humidity obtained by other means.

Suckers which were potted in the early autumn may be encouraged in growth, but the temperature should be kept a few degrees less warm than advised for larger successions, for if afforded low temperatures now, they will make a strong growth when repotted and started early in the new year. I would also advise the shifting of very strong suckers with plenty of roots, and placing them in the second house; these will give a quick return, although shifting in general is not advisable. *G. Wythes, Syon House, Brentford.*

THE KITCHEN GARDEN.

FORCING PITS.—The stalks of Rhubarb will now be making rapid progress, and when they have reached a length of 4 to 5 inches, water should be liberally afforded the soil. The produce will be improved in flavour if the structure can be ventilated several days previous to gathering. More roots should be put into heat at fortnightly intervals, or pots or boxes put over those in the open, and surrounded with warm dung and leaves.

FRENCH BEANS.—Supply plants in bearing with weak liquid manure once or twice a week. Young plants, when about 2 inches higher than the rim of the pots, may be moulded up with warm soil, and the points of the stems pinched out. Syringe the plants with tepid water on fine days, and sow seed at short intervals in quantity according to the accommodation at hand, so as to maintain a regular supply.

ASPARAGUS.—A bottom-heat of 70° and top-heat of 60° should be maintained in the Asparagus-pits or frames, maintaining a falling heat by means of dung linings, as any stagnation of growth now would impair the quality of the shoots. Ventilate the pits and frames in mild weather, and in accordance with the condition of the plants, those in which the shoots have not appeared above-ground wanting, in a general way, no air, unless it be to allow of the escape of an excessive amount of steam or warmth.

MUSHROOM-HOUSE.—Maintain a uniform moist condition of the air, and a temperature of 55° to 60°. If there are several beds in course of preparation, but little fire-heat will as yet be required. If the beds should get dry on the surface, as they will do if uncovered and fire-heat be employed, moisten the soil with tepid water applied with a fine rose pot or the syringe, and do not afford any more than is needed, especially in the earlier stages of growth.

Beds in full bearing in the event of their getting dry should be watered with tepid water 10° higher than that of the house, common salt being put into the water at the rate of 1 oz. to the gallon. Woodlice in the Mushroom-houses may be destroyed by pouring boiling water out of a long-spouted watering-pot along the sides and ends of the beds, after giving light to the house. Beetles may be caught in special kinds of traps, the Birkenhead beetle-trap being one of the best; and the best thing I find to bait them with is a piece of bread soaked in beer, and when baited they should be placed near the walls.

M SCCELLANEOUS.—On any indication of hard weather setting in, get up a plentiful supply of Celery, Brussels Sprouts, Savoys, Horseradish, &c., packing these into sheds ready for use; and any Parsnips or Jerusalem Artichokes still remaining in the ground may be protected with a covering of litter or bracken. Parsley may be protected with garden-frames or straw-burdles; and Chicory roots in the soil should be dug up and stored in sand or leaf-soil ready for forcing when the Endive and Lettuces have become scarce. *C. J. Waite, Glenhurst Gardens, Esher.*

THE FLOWER GARDEN.

MAKING GRAVEL-WALKS.—Where new walks are to be made, it is important that they should be made with due regard to their surroundings. If they are intended for vehicles as well as walking on, as is generally the case in the main walks in large gardens and pleasure-grounds, a greater depth of soil than would be necessary in the case of walks for pedestrians, should be dug out, to admit of a greater thickness of hard material being laid in the bottom for drainage, and to sustain the harder traffic. The first point to determine when making a walk after the line of direction has been decided upon, is the width that it shall be made. Main walks should be from 10 to 18 feet in width, according to the extent of the grounds, the others being from 5 to 7 feet wide. This done, due regard should be paid to the level of the ground on either side of the walk, as well as the direction in which it is proposed to take the surface-water. A depth of from 9 to 18 inches will, in a general way, be ample for walks of the dimensions mentioned above, but in cases where the top-soil is shallow, and resting on a substratum of chalk, gravel, or stone, all that is necessary is to remove the top-soil, and with which the ground on either side the walk can be made level, together with the filling up of any depressions that may happen to be close by. Whatever edging be used, turf, Box, flints, Heather, &c., it should be laid before the bottoming of the walk is proceeded with. The bottom of the walks should be deeper at the sides than in the middle, that is, it should be slightly arched or convex, so as to convey the surface-water to the sides. If the substratum be chalk, it should be well pounded all over, allowing sufficient fall (longitudinally) to the points towards which it is decided to drain the walks, providing means at each outlet to convey thither any water that might lodge on the opposite side of the walk—that is, when it is not convenient to have outlets connected with drains or "catch-pits" on both sides of the walk. In the case of walks being made on soils resting on a bed of chalk, gravel, or stone, as mentioned above, a smaller quantity of hard materials becomes necessary. A broad walk, having an excavated depth of 18 inches, should have at least 1 foot of coarse materials in the bottom, over this 3 inches of coarse gravel, followed by a like depth of fine red gravel, if obtainable. This should be raked level and smooth, and rolled as soon as dry enough—first with a light roller, and then with a heavy one, repeating the operation four or five days in succession or until a level firm surface is produced. Walks of from 9 to 12 inches deep should be given a layer of proportionate thickness of the several materials recommended for the walk described above. Bold yet graceful curves should be observed in making winding walks. Where Box is used as an edging, taste and judgment, only to be acquired by practice, are necessary to do the work with precision and neatness. *H. W. Ward, Longford Castle, Salisbury.*

THE HARDY FRUIT GARDEN.

PLANTING.—This work should be speedily pushed forward in favourable weather, so that it may be brought to a close by the end of the present month. In cold wet soils, planting often is deferred during the months of January and February, and brought to a close in the month of March. But where there is a great deal to do, planting may be done at any time,

except in very frosty weather in heavy land, scattering a few shovelfuls of fine and moderately dry soil over and amongst the roots. Standards, &c., should be afforded supports against wind, but in such manner as to allow the trees to sink as the soil settles. Much treading of the soil in a wet state should be avoided, but so soon as the surface is moderately dry, a good trampling over the roots does good.

All trees arriving from nurseries should at once be heeled-in till required for planting, the damaged roots being trimmed, so that nothing further will be required. If dry, immerse them completely in water.

DAMSONS stand the wind without much injury to crop or crown, and are therefore suited for the outside lines of orchards of other fruit trees, and they should stand thickly enough together that the future heads may afford shelter for the other trees. Farleigh Prolific, Blue Prolific, and Shropshire or Prune are good varieties of Damsons, all being serviceable in the household, and good market fruit. Plums, Victoria, Belgian Purple, Early Prolific, the Czar, Jeffersons, and, as a late one, Monarch, succeed well as standards, and are excellent as wall trees.

PEACHES AND NECTARINES.—The lifting and planting of these should be completed without delay, and, if good results are to be expected, plant on good, very firm soil that has not grown fruit trees previously, adding to the staple some fresh loam, old mortar rubbish, and burnt earth. If the soil be poor, a little manure should also be afforded, so as to furnish food for the roots at the start; keep most of the roots near the surface. If the holes have been properly prepared and drainage well done, with some turves, grassy side downwards, laid over it, fill up the holes and trample all firmly, but pricking the top soil before resting the roots thereon; keep the tree upright, and its stem 6 inches away from the wall at the bottom, shake a little fine soil amongst the roots, raise the tree a short space, drop it into its place, and cover to the depth of 6 inches, afterwards slightly mulching with long manure.

PEARS should also be planted similarly to Peaches. Cordons if planted in new soil in the place of old worn-out trees soon begin to bear fruit, and repay their cost and that of planting. These vigorous young trees are worth many of the old useless trees one sees in some old gardens, which are retained for what they have been but will never be again. *H. Markham, Mereworth Castle, Maidstone.*

THE ORCHID HOUSES.

THE EAST INDIA-HOUSE.—At this season it is usual for the Orchid-grower to make as bright a show of flowers as he can; this may be done very successfully, if *Phalenopsis amabilis*, *Calanthes* in variety, and *Cypripediums* are grown in quantity, notably *C. Spicerianum*, *Leeanum*, and *insigne*, these plants adapting themselves to easy and pleasing arrangements—a matter which should be studied by the grower of Orchids. The season just past, that has been so unsatisfactory for fruits and flowers, has been very suitable for *Phalenopsis*, and our plants have done better than for some years past, which I attribute in great measure to the small amount of sunshine that we have received, which goes to prove that the shading usually afforded these plants is not enough whilst growth is taking place. I paint the roof-panes, and make use of a thick roller-blind.

The newly-imported *Dendrobium Phalenopsis* are throwing up flower-spikes, so that it will probably prove to be an autumn-flowerer, thus adding to its value. The beautiful *D. Statterianum* and *D. bigibbum* last each for about two months in flower, as do *D. superbiens* and *D. Gouldii*. These are all winter-flowering *Dendrobiums*, each being sufficiently distinct that no collection seems quite complete without at least one plant of each. *D. heterocarpum* is a very useful *Dendro* for winter, as is *D. Findleyanum*. The old *D. nobile* is too well known to call for any remark; but I would just say this, that any amateur who is thinking of buying some of these for next year's flowering at Christmas-time, should buy those which are sold in flower at this season. It is a very easy matter for anyone to keep plants back when coming into flower, but it requires a skilled grower to bring a plant into flower successfully, without injury to the plant, in much less than twelve months. I am of course alluding now to those plants which have been growing in this country at least two years; imported plants will flower at all times.

THE INTERMEDIATE-HOUSE.—*Sopronites grandiflora* is an attractive plant, and its flowers when

they are arranged together with *Masdevallia tovarense* look charming by the contrast; the plant is easily grown, and should therefore be in every amateur's collection. It is usually called a cool-house plant, but I never was successful with it until I gave it a few more degrees of warmth; grown in baskets or pans and hung up near the light, the plants grow and flower admirably. We always pick all the peat and sphagnum moss from the roots annually, and wash the latter in soft water, also the basket. They require to be kept moist at the root even during the winter, and during growth too much water cannot be afforded, unless there is too much potting material about them, than which nothing is worse. The atmosphere in the different divisions should be kept rather dry, and the temperature about 62° for the East-Indian Orchids, 58° for *Cattleyas*, 55° intermediate-house, and 45° the *Odontoglossums* and cool Orchids, always remembering to ventilate every department more or less. *A. G. Catt, Parkfield.*

PLANTS AND THEIR CULTURE.

STREPTOCARPUS.—Considering the ease with which this species of plant may be grown, it is remarkable that they are not more frequently met with in gardens than is the case. Seeds of the plant may be sown in a pan of loam and leaf-soil in equal parts sifted through a fine sieve, sufficient sand being added to keep the whole porous. Give the pan of soil a slight watering, and when it is dry on the surface, sow the seeds thinly and evenly, and place a sheet of glass over the pan. If it be stood on some moisture-holding material, no more water will be required till the seeds have germinated. At this season of the year the seed-pans may be placed in the propagating-house, where the temperature is kept at from 55° to 60°. When the seedlings are large enough, prick them off into pans or shallow boxes, still keeping them in a structure where the temperature does not fall below the point indicated. In the course of six weeks from the time they are transplanted they will be ready for a shift into small pots, when a compost, consisting of two parts loam, one each of leaf-soil and decayed manure, and sand in proportion, may be used. During the summer months, the plants may be grown in the greenhouse or cold frame, always taking precaution to shade them from bright sunshine. The varieties *S. Rexii*, *S. parviflorus*, and *S. polyanthus*, will be found most suitable where only an ordinary greenhouse is at command, but where a little heat is at hand, the list may be extended by such varieties as *Watsonii*, *Dunnii*, and *Kewensis*. The present is a most suitable time to sow seed of *Streptocarpus*.

POTTING MATERIALS.—When the weather is favourable, lose no time in laying-in a supply of soils, getting the loam from an old pasture which has plenty of plant-roots in it, as this will be found more lasting, and afford better food for plants than any other. In cases where it is impossible to procure turf from an old pasture, and where it is found that the quality is not good, it will be advisable, when stacking that which is obtainable, to place between every second layer of turf a layer of sheep or deer's droppings, or failing these, half-decayed stable manure, which will greatly enrich the loam by the time it is required for use. In cutting the turves, it is a mistake to cut them too large; a most suitable size is 14 inches by 8 inches, and 1½ inches in thickness, and to have the whole neatly stacked, if possible, when the weather is dry.

LEAF SOIL.—A quantity of this should likewise be prepared, and some of it taken under cover, in case of a long spell of severe weather. The best leaf-mould is generally found in an old rookery, where the tree leaves have been allowed to remain and decay for a number of years, and with the manure from the birds this makes a very rich potting material.

PEAT.—The stock of peat should be examined, and note taken of the quantity which will be required for the coming season. The above remarks will also apply to the store of silver sand, cocoa-nut fibre, pots, stakes, &c., which should be got in readiness for the busy season. All surplus pots should be washed, sorted and stacked away. It is a good time to put the potting shed in good order, and for limewashing the walls, soil bins, &c. All this kind of labour may be done when the weather is unfavourable for out-door work. *R. Milner, Peartree Castle, Swansea.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, DEC. 14—Eastbourne Horticultural Society.
TUESDAY, DEC. 15—Sittingbourne.
THURSDAY, DEC. 17—Linnean.

SALES.

MONDAY, DEC. 14 { Dutch Bulbs, at Protheroe & Morris' Rooms.
14,870 Liliom auratum, also other Lilies and Bulbs, at Protheroe & Morris' Rooms.
TUESDAY, DEC. 15 { Fruit Trees, Roses, &c., at Charlton Nursery, near Shepperton, by Protheroe & Morris (two days).
Plants from Belgium, Begonias, Ferns, &c., at Protheroe & Morris' Rooms.
WEDNESDAY, DEC. 16 { Border Plants, at Stevens' Rooms.
Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY, DEC. 17 { Glass Frettings, &c., at Balham, by Protheroe & Morris.
Rose and Fruit Trees, at Stevens' Rooms.
FRIDAY, DEC. 18 { Orchids, at Protheroe & Morris' Rooms.
Dutch Bulbs at Protheroe & Morris' Rooms.
SATURDAY, DEC. 19 { Lilioms, Dutch Bulbs, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°·3.

REVERTING to this subject, see *ante*, p. 616, we believe that the first to apply the electric light to cultivation upon the larger scale were made in this country by SHEPPARD; others have also endeavoured to make use of it, but with indifferent success. More recently the distinguished Russian agriculturist, SPECHNEV, has been carrying on experiments on the larger scale for several years continuously. SPECHNEV commenced by watching the application of electricity to the germination of Wheat, and he observed that the growth was much more rapid when this application was made than under ordinary circumstances.

The next experiments were made with dynamic electricity. Large plates of zinc and copper were connected with wires, and buried in the soil; between these plates Beans, Carrots &c., were cultivated, and in every case a finer crop was obtained.

Static electricity was next experimented with, the plants being arranged within the influence of collectors of atmospheric electricity. For five years experiments were systematically conducted, and the results appear sufficiently indicative of the powerful action exerted by electricity on the growth of plants. Here are some figures for comparison, in each case the same quantity of seed being grown:

Description.	Electro-culture.		Ordinary Culture.
	Kilogrammes per hectare.		
Wheat	{ Grain ...	1,641	1,282
	{ Straw ...	4,489	2,800
Corn	{ Grain ...	2,000	1,200
	{ Straw ...	2,500	2,600
Potatoes	{ Tubers ...	19,500	17,500
	{ Stalks ...	2,400	1,800

A hectare is about 2 English acres.

We may now notice a successful experiment recently carried out by Mr. RAWTON, of Arlington, Massachusetts, U.S.A. He has begun examining the action of electric rays upon plant-

life, and has succeeded in proving that it would be of considerable advantage to gardeners in forcing vegetables, &c., under glass for the early markets.

Mr. RAWTON has confined his experiments to the growth of Lettuces in a greenhouse about 70 yards long by 8 wide. Every day the greenhouse was illuminated by means of an arc lamp, and throughout the night as well. We do not know whether the light was softened at all by means of glass shade or otherwise; but, bearing in mind the researches of Sir W. SIEMENS, we suspect that some such device was resorted to.

The results obtained by Mr. RAWTON were of a highly encouraging nature, and showed an improved rate of growth, equal to about 20 per cent.; so that at this rate the gardener who uses the electric light gains one week in every five on his competitors who trust to unassisted Nature—a fact which is well worth pondering over.

There is a market for everything that is "out of season" and the gardener who first exploits the market can command almost any price, and, according to Mr. RAWTON, will make profits which will recoup the installation and maintenance of the electric light. This gentleman ought to know what he is about, and we may note that he has been so encouraged by the financial success of his experiments that he is laying out greenhouses fitted with the electric light on a large scale.

A small fact brought out by these American researches is worth noting—viz., that whilst the electric light hastens the growth of plants, it does not encourage insect pests.

Meanwhile, researches have been going on nearer home. Our French contemporaries are always well to the front in exploiting new ideas, and the alleged affirmative results which have lately been obtained in the application of electric light and electric currents to the growth of certain plants, have set a good many others at work upon this curious development of electrical science.

Fresh evidence in favour of the advantage of employing electricity in plant culture has been recently adduced by M. BARAT, of Aiguillon, Lot et Garonne, who is an enthusiastic believer in employing this agent, and has been at work with it since 1880.

In spite of the suspicion with which one is generally inclined to regard the experimental results obtained by admitted enthusiasts, we must say that M. BARAT'S investigation bears every appearance of being genuine, and the account which he gives of it by no means highly coloured.

Electricity was applied to the cultivation of Potatoes, Tomatoes, and Hemp—typical plants which indicate no bias in their selection. A row of Hemp was subjected intermittently during its growth to the action of an electric current, which was passed through the soil in which it was planted. When the stalks were mature, they measured on an average 18 inches longer than those in a row of Hemp which had been grown under otherwise similar conditions for the same space of time.

Patches of Potatoes were similarly treated, some being grown in the path of an electric current, whilst others were cultivated normally. Equally remarkable results were obtained in this case also; for whilst 1 kilogramme of seed Potatoes produce 21 kilogrammes of large and well-conditioned tubers, the same quantity of seed grown in a similar but not electrified patch only yielded a crop of 12·400 kilogrammes, and the tubers were by no means so large nor so healthy as in the former instance.

The influence of electricity appears to be exerted chiefly in promoting early maturity; at least, this was notably the case when the Tomatoes were experimented upon, for the fruit ripened eight days earlier. Now, the late Sir W. SIEMENS showed that under the influence of the electric light, fruits like Strawberries, &c., ripened much faster, and Wheat and other plants grew much faster; and hence, if M. BARAT had also kept the electric light shining on his Tomatoes at the same time as he was passing the electric current through the soil, it is possible that still more remarkable results might have been obtained.

The experiments which we have just quoted have been carried out during the past season; during their progress, M. BARAT observed an important fact, which is worth recording. When two metal plates were sunk in the soil, and connected by means of wires with the poles of a battery, and when manure was placed in the neighbourhood of one of these plates, on the current being passed, the constituents of the manure were transported through the soil in the direction of the other plate. Thus the fertilising effects of a small quantity of manurial substance was spread to a considerable distance, and in much less time than it could be effected by ordinary liquid diffusion.

This is new evidence also in favour of the theory adopted by SPECHNEV, the Russian agriculturist, whose researches into the cause why an electric current appears to produce great fertility in the soil through which it is passed, led him to ascribe it to a kind of electrolytic action, whereby the active principles existing in the soil, or in the manure with which it is treated, are scattered in such a way that they are brought into a more available position as regards the roots of the plants, and thus the latter get a better food supply.

A theory which has been promoted for explaining the favourable action of electric light upon plant-life, is based upon the richness in actinic rays which it possesses. It has been proved that the luminous rays of sunlight are accompanied by others which possess heating power, and by others also which are chemically active; these last are called the actinic rays, and the chemical action of sunlight is called actinism. This explanation is open, perhaps, to some objection, but it is simple, and easily understood, and practically correct. It is believed that the assimilation of material adapted to vegetable growth from the inorganic binary compounds in the soil, and the carbonic acid and water depends upon the action of these actinic rays upon the cell contents of plants. Now the electric light is exceptionally rich in actinic rays—i.e., rays which are chemically active—and hence upon this fact its favourable influence on vegetation depends.

Professor BAILEY, of Cornell University, has recently published, in the *Bulletin* of the Agricultural Department of that College, an interesting account of some experiments made by him, and which he compares with the experiences of DEHÉRAIN and of SIEMENS. Professor BAILEY'S conclusions are as follow:—

"It is impossible to draw many definite conclusions from the above researches. The many conflicting and indefinite results indicate that the problems vary widely under different conditions and with different plants. Yet there are a few points which are clear: the electric light promotes assimilation, it often hastens growth and maturity, it is capable of producing natural flavours and colours in fruits, it often intensifies colours of flowers, and sometimes increases the production of flowers. The

MINLEY MANOR, NEAR FARNBORO'.

experiments show that periods of darkness are not necessary to the growth and development of plants. There is every reason, therefore, to suppose that the electric light can be profitably used in the growing of plants. It is only necessary to overcome the difficulties, the chief of which are the injurious influences upon plants near the light, the too-rapid hastening of maturity in some species, and, in short, the whole series of practical adjustments of conditions to individual circumstances. Thus far, to be sure, we have learned more of the injurious effects than of the beneficial ones, but this only means that we are acquiring definite facts concerning the whole influence of electric light upon vegetation; and in some cases, notably in our Lettuce tests, the light has already been found to be a very useful adjunct to forcing establishments.

"The experiments suggest many physiological speculations, upon which it is not the province of this bulletin to enter. Yet two or three of them may be mentioned. It is a common notion that plants need rest at night, but this is not true in the sense in which animals need rest. Plants have simply adapted themselves to the conditions of alternating daylight and darkness, and during the day they assimilate or make their food, and during the night, when, perforce, assimilation must cease, they use the food in growth. They simply practice an individual division of labour. There is no inherent reason why plants cannot grow in full light, and, in fact, it is well known that they do grow then, although the greater part of growth is usually performed at night. If light is continuous, they simply grow more or less continuously, as conditions require, as they do in the long days of the arctic regions, or as our plants did under continuous light. There is no such thing as a plant becoming worn out or tired because of the stimulating influence of continuous light.

"It would seem, therefore, that if the electric light enables plants to assimilate during the night, and does not interfere with growth, it must produce plants of great size and marked precocity. But there are other conditions, not yet understood, which must be studied. Our Radish plants, and many others, were earlier but smaller under the influence of the light. Observation and chemical examination showed that a greater degree of maturity had been attained.

"Perhaps they assimilated too rapidly, perhaps the functions of the plant had been completed before it had had time to make its accustomed growth. Perhaps the highly refrangible and invisible rays from the electric lamp have something to do with it. In fact, this latter presumption probably accounts for much if not all of the injury resulting from the use of the naked light, for the effect of the interposition of a clear pane of glass is probably to absorb or obstruct these rays of high refrangibility. Good results which follow the use of a globe or a pane of glass show, on the other hand, that the injury to plants cannot result from any gases arising from the lamp itself, as has been supposed by some observers. In our own experiments, particularly with the Brush lamp, there was no perceptible odour from the gases of combustion; and it may also be said that commercial forcing-houses, like our own, are not tight enough to hold sufficient quantities of these gases to injure plants.

"It is highly probable that there are certain times in the life of the plant when the electric light will prove to be particularly helpful. Many experiments show that injury follows its use at that critical time when the plantlet is losing its support from the seed, and is beginning to shift for itself, and other experiments show that good results follow its later use. This latter point appears to be contradicted by DEBÉRAIN'S results, but his experiments were not conducted under the best normal conditions.

"On the whole, I am inclined towards SIEMENS'S view, that there is a future for electro-horticulture."
"L. H. BAILEY."

At present, then, there is naturally some difference of opinion concerning the use of electricity in agricultural and horticultural operations, and, as usual, there are some who entirely scout the

idea that any good can result, or, at least, that there is "any money in it." On the other hand, there are others who as strenuously affirm that we are on the eve of very important discoveries, which shall lead to unexpected developments in the practical application of electricity. Perhaps the real truth lies somewhere between these two extremes.

OUR ALMANAC.—Secretaries of Societies and others are earnestly requested to forward shortly, the dates of show fixtures, and meetings of horticultural societies of any kind for 1892, for insertion in the Almanac to be published in our issue for January 2.

THE EX-EMPEROR OF BRAZIL.—DOM PEDRO, the former sovereign of Brazil, who died in Paris on the 4th inst., was remarkable not only as a model sovereign, but for superior intelligence generally, and for his sympathy with literature, science, and art. In these particulars he was considerably in advance of his subjects. He afforded great encouragement in the publication of the magnificent *Flora Brasiliensis*, in the preparation of which several of our English botanists have taken part, while his actual scientific attainments were such that even the Academy of Sciences of France elected him among its corresponding members.

M. ALPHAND.—This gentleman, who died in Paris early this month, was seventy-four years of age, having been born at Grenoble in 1817. By profession an engineer, he was also City Surveyor of Paris, and to him are due many of the architectural effects of that city, as well as the extensive planting of streets, squares, and boulevards. M. ALPHAND was the author of a magnificent work, published by Rothschild, on the *Parks, Gardens, and Promenades of Paris*. M. ALPHAND had much to do with organising the successful exhibition of 1889.

LINNEAN SOCIETY.—On the occasion of the meeting on Thursday, December 3, Professor STEWART, President in the chair, the following gentlemen were elected Fellows:—Sir WALTER SENDALL, Messrs. T. M. MACKNIGHT, W. A. BLAUBER, C. FROST, H. SUTHERLAND, J. KEYS, W. S. CAMPBELL, A. MOLINEUX, and W. H. STRACHAN. The President announced the recent bequest by the late Sir GEORGE MACLEAY, K.C.M.G., of a marble bust of his father, the late Dr. WILLIAM SWAMP MACLEAY, formerly a Fellow and Vice-President of the Society. The botanical secretary read a paper by Mr. W. WEST, on "Fresh-water Algae of the West of Ireland," and exhibited, by way of illustration, a number of preparations under the microscope, and a series of beautiful drawings by the author. The paper was criticised by Messrs. A. W. BENNETT and E. M. HOLMES, both of whom testified to the excellence of the work done, and the value of the drawings. At an evening meeting, proposed to be held on Thursday, December 17, at 8 P.M., the following papers will be read:—1. "Development of the Head of the Imago of Chironomus," by Professor L. C. MIALL and Mr. A. R. HAMMOND. 2. "On Two Species of Cumacea in New Zealand," by Mr. G. M. THOMSON.

SMITHFIELD CLUB.—Roots, including Mangel Wurzel, Swedes, Turnips, &c., were somewhat extensively shown at the Smithfield Club Cattle Show, which opened on Monday last at the Agricultural Hall, Islington. Messrs. SUTTON & SONS, CARTER & Co., JARMAN & Co., DICKSONS (Chester), and HARRISON & SONS, had their usual displays of agricultural seeds as well, while Potatoes were not forgotten. A large collection of tubers was exhibited by Mr. WHITEHEAD COUSINS, Covent Garden, including the best market-growing varieties. Among other things Messrs. J. CHEAL & SONS, Crawley, showed a fine collection of well-coloured Apples, the most conspicuous of which were Blenheim Orange, The Queen, Warner's King, Cellini, and a new variety named Atalanta.

THE SACRED PLANT OF THE DRUIDS.—Mr. STEELE, of the Edinburgh Naturalists' Society, is

trying to prove that the Beef-steak Fungus, and not the Mistletoe, is the sacred plant of the Druids. He infers this, because the Fungus is parasitic on Oaks, while the Mistletoe is not, saying further that the red juice of the Fungus was shed by the Druids, when sacrifices having been abolished, human blood could not be obtained for their ceremonials.

MR. G. T. BETTANY, who died from heart disease on December 2, is known in the literary world as the author of several books of biography and science, including a life of CHARLES DARWIN, and as English editor of *Lippincott's Magazine*. Among other appointments, he held for eight years that of lecturer on Botany at Guy's Hospital.

JAPAN SEDGE MATS FOR PLANT PROTECTION.—At McARTHUR'S Nursery, Maiden Vale, London, W., specially-made sedge mats, 6 by 5 feet, manufactured in Japan, are employed to replace the untidy Archangel mats, which have a habit of fraying out and littering the gardens where they are used. These Japan mats are neater, warmer, and it is said more durable, while their cleverly-finished edges render it impossible for them to get ragged. In some good gardens where they have been tried, they have given great satisfaction.

"THE ROSARIAN'S YEAR BOOK FOR 1892," as edited by the Rev. H. HOLYWOOD D'OMBRAIN, A.B., Hon. Sec. of the National Rose Society, is announced for publication on January 1, 1892. Its contents comprise articles on "Mr. T. W. Girdlestone (with photograph)," by the Editor; "The Ethics of Rose-showing," by Mr. E. B. Lindsell; "Experiments in Rose-hybridising," by the Right Hon. Lord Penzance; "Rose Jettings in 1891," by Mr. Alex. Hill Gray; "Roses near big cities," by Mr. J. Bateman; "The Rose, and the National Rose Society in 1891," by the Editor; "The Rose as a Garden Flower," by Mr. W. J. Grant; "Stocks," by Mr. F. Cant; "The Comparative Hardiness of Tea Roses, and their Winter Protection," by Mr. Geo. Paul; and "The Rose Weather of 1891," by Mr. E. Mawley, F.M.S., Hon. Sec. National Rose Society. The publishers are Benrose & Sons, 23, Old Bailey, London; and Derby.

THE CRÉPIN CELEBRATION.—On the 6th inst. an imposing demonstration was held in honour of Professor CRÉPIN, the Director of the Brussels Botanic Garden, and Secretary of the Botanical Society of Belgium. The meeting was presided over by Professor GRAVIS, and was attended by the Minister of Agriculture, the Burgomaster of Brussels, and most of the colleagues and associates of M. CRÉPIN. A prize, to be called the "Crépin Prize," was established, and the honoured Professor was advanced to the grade of Officer of the Order of LEOPOLD. A banquet followed the official business. We have received from our correspondent a long account of the proceedings as we are about to go to press, on which account we must postpone further details till our next issue.

NATIONAL ROSE SOCIETY.—The annual meeting and dinner of this flourishing Society were held on Wednesday last at the Horticultural Club, Hotel Windsor. The following arrangements for 1892 were decided upon:—The Tea and Noisette Exhibition will be held under the auspices of the Royal Horticultural Society, at the Drill Hall at Westminster, on Tuesday, June 21; while the Metropolitan Exhibition will take place at the Crystal Palace on the first Saturday in July. At the request of the Mayor and Corporation of Chester, the Society's Provincial Exhibition will be held in that city on Thursday, July 14. A proposed new regulation, that "At the two principal exhibitions of the Society, amateur exhibitors shall be required to show according to the number of plants of 'exhibition' varieties grown by them," was proposed by Mr. C. J. GRAHAME, seconded by the Rev. F. R. BURNSIDE, and ultimately referred to the Committee to see in what manner the regulation can be carried out. The financial statement was satisfactory.

BRITISH FLIES.—Mr. F. V. THEOBALD is publishing in monthly parts, through Mr. ELLIOT STOCK, an account of British flies, illustrated with woodcuts. When one considers the enormous losses inflicted on farmers and gardeners by one class of flies only, the Cecidomyiidae—a loss that has to be reckoned by hundreds of thousands of pounds every year, it becomes evident that a good account of their structure and mode of life are all important in seeking means to prevent or palliate their attacks. The book promises to be well done, but we may call the author's attention to the circumstance that the Baberry is not the same as *Barbarea vulgaris*. Oh! those dreadful popular names!

THE CHICAGO EXHIBITION.—On the roof of the horticultural building, around the central dome at the Chicago Exhibition, an elaborate display of roof-gardening will be made. It is expected that this will not only be pleasurable to visitors, but will afford valuable suggestions that will be utilised by persons who live in large cities, and are deprived of gardens and lawns. In the centre of the horticultural building will be a miniature mountain, 70 feet high, upon which will grow tree Ferns and Palms, and other vegetation, finding there a congenial home. A stream will dash from one declivity to another. Beneath this rock-mountain will be a cave, 80 feet in diameter and 60 feet high, brilliantly lighted by electricity, where, during the whole six months of the Exposition, the experiment will be tried whether plants will grow under electric light as well as under sunlight. Mr. J. THORPE originated the plan.

PUBLICATIONS RECEIVED.—*The Journal of Botany*, West, Newman & Co., 54, Hatton Garden, E.C.—*The Horticultural Directory and Year Book for 1892*, published at the *Journal of Horticulture* Office, 171, Fleet Street.—*Cassell's Christmas Annual Yuletide*.—*The Queen*.—*The Princess*.

PLANT PORTRAITS.

ALLAMANDA WILLIAMSII, *Garden*, November 21.

NOTHOLENA RIGIDA, n. sp.—A new species from Monterey, Mexico. Collected by Pringle, and described and figured in *Garden and Forest*, November 4, by Mr. G. E. Davenport. It has lanceolate bipinnate fronds, 8 to 12 inches long. The edges of the pinnules revolute. The stalks are a dark chestnut brown.

PEAR BEURRÉ DE MORTILLET.—Fruit large, or even very large, skin yellow flushed with red. Flesh fine, melting, white, juicy, sugary, and perfumed. A good market Pear, in season at beginning of October.

RONDELETIA SPECIOSA, *Revue Horticole*, November 16.

VITIS ROMANETI VARS., *Revue Horticole*, 1891, p. 520.

NOTICES OF BOOKS.

MY GARDENER. A PRACTICAL HANDBOOK FOR THE MILLION. By M. W. Ward. (Eyre & Spottiswoode.)

The most effective way of reviewing such a useful and practical book as this, is to allow the author to speak for himself. Here, for example, is the writer's account of Cabbages, p. 29:—“(*Brassica oleracea capitata*). This is a hardy biennial, derived from *B. oleracea*, which is found wild in Cornwall, Wales, Yorkshire, and near Dover, in Kent. It is also found wild on the coasts of France, and of many European countries. It was known to the ancient Gauls by the name of Chou Capa. Of the Cabbage, like many other garden vegetables nowadays, there are too many varieties enumerated in trade lists. They want weeding out considerably, as it is rather bewildering to those not practically acquainted with the leading sorts and varieties of vegetables to make a good selection from a trade list. The wisest plan in this case would be to leave the selection to the seedsman. However, following the plan which we adopted when beginning this work, we shall make the matter of selection easy for those who consult these pages; therefore, out of a

hundred or more varieties of the Cabbage which are to be found in catalogues, we shall mention only a few of the very best, which will serve the purpose of any cultivator as well, and indeed better, than if he grew all the varieties named in the catalogue. They are Carter's Early Heartwell Marrow, Sutton's All Heart, Veitch's Matchless, Wheeler's Imperial, Welch's Emperor, Daniel's Defiance, Nonpareil, Enfield Market, Red Dutch for pickling, and Rosette Colewort for sowing in June for early winter use.” Of each of these a short description is given, and then follows on p. 30 a paragraph relating to the soil and its preparation.

Dipping into fruit culture, the author remarks:—“No cottage garden can be considered complete without it has a due complement of Apple, Pear, Cherry, and Plum trees, Gooseberry and Currant bushes, Raspberry and Strawberry plantations. The varieties of the several kinds that are known to succeed best in each district should be borne in mind by the purchaser in sending his fruit-tree order to some nurseryman having a reputation for the growth and for sending out healthy trees, true to name. To such a man the intending purchaser, who is not quite sure as to the most suitable of the several kinds and varieties to grow, may safely leave the selection, (1) simply giving the names of the sorts he may already have, and (2) stating how many trees each of Apples (for cooking and dessert), Pears, Plums, &c., he requires, together with the character and depth of the soil in his garden or orchard. Those having gardens enclosed by a wall, or boarded by a fence, should grow one or more trees of Peaches or Nectarines and May Duke Cherries on the south and west sides; Victoria, Golden Drop, and Old Greengage Plums, Marie Louise and Chaumontel Pears on the east side, and Morello Cherries on the north side. Fruit trees of every description, including bush fruit and Strawberries, do best in a deep yellow loam, resting on limestone or a gravelly subsoil, and inclining to be heavy rather than light.”

A short list of Apples, with two striking illustrations of Beauty of Bath, is prefaced by this brief note on the Apple (*Pyrus malus*). “The Apple, termed in its wild state the Crab, is indigenous to Britain, as to most warm and temperate parts of Europe. It will succeed in climates too cold for the Pear, Plum, and Cherry, and blossoming later than any of these (May); it therefore generally escapes the frost, which frequently destroys the crops of the fruit trees indicated.”

Dessert Varieties.—Beauty of Bath, Irish Peach, Cox's Orange Pippin, Red Astrachan, King of the Pippins, Cockle Pippin, Nonpareil.

Culinary Varieties.—Keswick Codlin, Lord Suffield, Hawthornden, Warner's King, Bramley's Seedling, and Blenheim Orange.

A baker's dozen that it would be difficult to beat, though among the suitable varieties we hold that one Codlin, Lord Suffield, is sufficient, and would substitute Cellini for Keswick Codlins, and also make sure of growing the New Hawthornden not the old one.

Of flowers it is to be regretted that space cannot be found for an account of the Violet. Passing on to p. 217, the author thus writes of the Anemone coronaria (Wind flowers): “The Anemone is associated with our earliest recollections of garden flowers, the erect spikes terminating with large flowers of bright and soft shades of colour, showing off to great advantage above the dark and pale green, finely divided, and handsome leaves, and create a favourable impression in the minds of all who see them in early spring. The garden varieties have mostly been obtained from *A. coronaria*.” After describing the soil, taking-up, and storing, we have a list of half a dozen double French varieties. Among the flowers may also be found a description of about 100 varieties of Roses. The proofs have not been so carefully read as they might have been, especially as regards the names of plants. The illustrations are mostly from catalogues, and are misleading as to the relative size and proportion of the objects depicted, as no scale is given to aid the reader.

Nevertheless, the book is replete with valuable cultural notes indispensable to the millions who are now turning to gardening as a source of pleasure and of profit.

THE BIRDS OF OUR RAMBLES.

This is the work of the well-known bird-book writer, Mr. Charles Dixon. It is an interesting volume, not too scientific to suit the general reader, for whose instruction, indeed, it is principally intended. The chapters treat respectively of many of the birds seen around our homesteads, gardens, fields, woods, mountains, and sea-shores, and include short descriptions intended to aid the casual observer to identify the various species by the peculiarities of their flight, note, or general appearance.

Thus, when speaking of swallows and martins, the author reminds us of the differences between them, although “to the unorthodox both birds are known indiscriminately as ‘swallows,’ and are generally alluded to as such.” Another popular error is that which “associates the swift with the swallow, and certainly, so far as habits and outward appearance go, there seems much in favour of the supposition. But the swift is not a Passerine bird at all, and belongs to the great order Picariae, a group which contains, among others, the goatsuckers, the kingfishers, the woodpeckers, and the hummingbirds.” Mr. Dixon does not profess to mention all of the birds to be seen in country rambles, and, owing to the classification of the chapters into localities, some common species are mentioned more than once.

The book is illustrated by Mr. A. T. Elwen, is well got up, and published by Messrs. Chapman & Hall, in a style uniform with other books by the same author.

In conclusion, we repeat that *Birds of our Rambles* will prove especially useful to inquiring amateurs as a book of reference—a general index would make it still more suitable for this purpose—while those who read only for pleasure will like the descriptions of old favourites and familiar friends, as well as those of rarer and less-known species.

A HANDBOOK OF BRITISH COMMERCE, ETC.

By P. L. Simmonds, F.L.S. (London: Moffatt & Page.)

It is obvious that some 200 pages of even moderately small type must be quite inadequate to do justice to a handbook of British commerce. They may, however, serve to indicate, to some extent, the variety and volume of British imports and exports, and this function is fulfilled by the pages of the little volume before us. When we say that it is the work of a skilled compiler, Mr. P. L. Simmonds, who long ago won his spurs, we have said enough to recommend it to the notice of those by whom indications rather than exhaustive treatment are desired. It consists, in fact, of an alphabetical index of commercial substances and manufactured products in a very condensed form, how much so may be illustrated by the circumstance that four lines are all that are devoted to acetic acid, and so on in proportion. Of “Burgundy” all that we are told is that it is “a light French red wine;” while “cannon” are described as “large military engines, pieces of ordnance for discharging balls.” “Cedar” is badly treated, it being difficult to discern what is meant; but it seems certain that neither of the plants mentioned is (except in a commercial sense) a Cedar, whilst the true Cedar is not named. Now that an outcry is made about the use of feathers for the decoration of ladies' garments, it is as well to note that monkeys, our near relatives, are almost as much persecuted by the fashionable world as are birds. Mr. Simmonds tells us that in 1887 more than 118,000 monkey-skins were shipped from the Gold Coast alone.

A very useful addendum to Mr. Simmonds' little book consists in the list of imports in 1890, together with their quantities and value. In this list Apples figure to the amount of two and a half million bushels, of the value of £780,072. Onions were

imported to the amount of nearly four millions of bushels, their value being £724,020. Surely, a large proportion might have been grown at home. Our total imports are given as amounting in value to £420,691,997, while we export no more than a quantity the value of which is given at £328,252,118.

HOME CORRESPONDENCE.

THE CLASSIFICATION OF ROSE AMATEURS.— Though heartily agreeing with a great deal of what "Rosa" writes on p. 639, respecting the above, I must say I cannot follow him when he says the plan of counting the number of plants as a guide to the

bulk. More depends upon the staging than many think, and it is not always the best Roses which win. Such benefits as naturally-good Rose soil and sheltered or favourable positions can, I admit, not be taken into due consideration when classifying exhibitors. But we can do something towards making things more fair for the smaller growers by limiting the quantity of exhibition Roses to be grown by any competitors in certain divisions. "Rosa" rightly remarks that many small growers are found among the leading prize-takers. Notably, Mr. A. Slaughter, of Steyning, who has often taken very high honours in the higher classes for amateurs. Mr. Slaughter's ground is very small, and he has room for but few plants, as I know. When a small grower like this wins against heavy men, that is so much more to his credit. I name Mr. Slaughter

To my mind this is plain enough. If he cannot win against men of his own calibre, why should he compete against little men? I quite agree with "Rosa" when he says, "Let the best Roses win;" and there are some small classes set apart for all and any competitors at the National Rose Society's shows; but I do not think it fair to compel small growers to compete against all who choose to drop into their class. Perhaps if there were a few more larger "open" classes, as well as some such scheme as Mr. Grahame's, it would meet the difficulty to a great extent. Many amateurs of my acquaintance are very strongly in favour of Mr. Grahame's idea. A. Piper.

JERUSALEM ARTICHOKE.—I must really apologise for again venturing to ask for space for a few lines.

FIG. 104.—PLAN OF WINTER GARDEN AT MINLEY. (SEE P. 695.)

division one should compete in, is "impracticable." Why could not some local member of the National Rose Society assist by checking the number of plants of the varieties catalogued as exhibition Roses? This would very seldom be necessary, because almost all exhibitors are already aware of the quantity of plants each grows, more or less. Where it was doubted if an exhibitor was competing in his right class, the matter might easily be settled by a member of the National Rose Society's committee visiting the place. But I do not imagine we should often be put to any such trouble, nor do I for one moment think rosarians are likely to give false figures. "Rosa" is undoubtedly correct when he mentions that one person will stage his blooms to far more effect than another. I have seen exhibitors fussing and troubling over their flowers for a long time, and after all, one could sometimes choose and stage a dozen from their spare blooms that would win the prize against those first chosen from the

because his case shows very plainly what cultivation will do. The garden at Jarvis Villa is far from an ideal Rose locality, either as regards its natural soil or situation. Nothing but skill and a genuine love for the Rose have gained Mr. Slaughter so many prizes among growers of thousands compared to his hundreds. This is also a case where tasteful and careful staging have assisted the exhibitor. Every visitor to the National Rose Society's exhibition for some years, must have noticed how every little point was made to tell in Mr. Slaughter's staging. What I consider unfair is, for a man with, say, 2000 plants (of exhibition varieties), to compete against the small grower, who has only 500, or sometimes less. Mr. Grahame's scheme avoids this unfairness as far as possible, and the objections to it, on the ground of impracticability, do not seem to me to be based on sound arguments. "Rosa" asks where the injustice comes in, "so long as these large growers do not show in their own larger classes."

which shall certainly be the last so far as I am concerned in this discussion, to reply to Mr. Dod, p. 651, where he makes the apology for a former mistake by blaming *Genera Plantarum* as the culprit, saying he got his reference to fruticose Sunflowers from p. 376 of vol. ii. of that standard work. Unfortunately for Mr. Dod's arguments, the reference there is p. 585 of the *Prodromus* and not p. 590, and is made to the whole genus of *Helianthus* contained in De Candolle's *Prodromus*, commencing at p. 585 of vol. v. Singularly enough, the No. 1 species on that page is *Helianthus annuus*, there stated as a native of Peru and not fruticose; from this work we also find reference to No. 26, *H. procumbens* and *H. verbesinoides*, both from Peru, the latter the fruticose one which Mr. Dod wishes to refer to at p. 591. We have also references in the *Genera Plantarum* to *H. rugosus*, another Peruvian species, and also to Jacquin, *Hort. Vindob.*, t. 160, 161, who is the recognised authority for *H. tuberosus*, being of South

American origin. Steudel, on the authority of Anton de Arrabida, mentions *H. brasiliensis* and *H. herbaceus*, both from Brazil. I read the Latin description of the *Genera Plantarum*, referring to the *H. hianthus* as meaning the majority, North American, and the minority Peru and Chili. I have only Asa Gray's *Bot. N. U. S.*, for 1878, to refer to at the moment, and I find p. 228, sp. No. 15 is *H. doronicoides*, Lam., with no mention of tubers, and No. 16, *H. tuberosus*, L., described as tuber-bearing and there said to be naturalised in fence rows and around gardens. I have also referred to Mr. Dod's writings on *H. doronicoides*, vide *Garden*, September 20, 1884, where that gentleman states he is distributing largely a plant which he thinks is *H. trachelifolius* of Asa Gray, under the erroneous name of *H. doronicoides*, by which he received it. That he had long since discarded *H. doronicoides* of Asa Gray, a plant worse than worthless for ornamental purposes, said to be a variety of *H. tuberosus*, but the roots are not tubercous. The year following in the *Gardeners' Chronicle*, September 12, 1885, p. 330, Mr. Dod recommends *H. doronicoides* as a very ornamental species, and he also mentions having received from Ipswich another species which answers in all respects to Asa Gray's *H. latiflorus*, under the name of *H. doronicoides*. The most curious deduction from all this is, that neither of the four seems at all to agree with Lamarck's *H. doronicoides*, mentioned by one American botanist as having a branched stem, and by Asa Gray as having showy heads. Whatever result we may arrive at as to the native country, it will not alter the fact that the Jerusalem Artichokes arrived into Europe before 1616 A.D., and were first conveyed there by way of Brazil, and probably Portugal. *Wm. Eltherington Dixon.*

TOMATOS AND CUCUMBERS FOR MARKET, ETC.—In reply to your correspondent, "N. H. C.," p. 651, I have tested for more than forty years nearly all the new varieties of Tomatos and Cucumbers as soon as sent out, and consider the best Tomato for market purposes to be Ham Green Favourite. It is a fine grower, heavy cropper, with smooth, round, heavy fruit, solid, and of good flavour. As regards Cucumbers, I may say, without fear of contradiction, that Lockie's Perfection is the most useful variety in cultivation, and, although rather small, it is handsome, a wonderful cropper, and of good eating. *T. L.*

CHRYSANTHEMUM ETOILE DE LYON.—I cannot agree with what Mr. Ward says of this fine variety. I have grown about thirty blooms of it this season, most of the blooms 10 inches across, and some more, and all were well up in the centre, the petals well reflexed on the outside of the bloom, forming almost a globular outline, the colour of the deepest pink in most of the late blooms. Now, what more could be desired in a Japanese Chrysanthemum, as the variety is a very vigorous grower, and it forms a fine decorative plant for the conservatory, for which purpose it should be grown in quantity. *C. Raffill, The Gardens, Summerhill, Kingswinford.*

VARIEGATED PALM.—I took, some seven years ago, at the Château Talabot, at Marseilles, some seed of *Chamaerops excelsa*, from which I raised a great number of plants, of which one is variegated. It is perfectly healthy, but slow of growth, and it will be some years before it produces seed of its own. *D. Toulon.*

PRIMULA NIVALIS.—On p. 680 of the *Gardeners' Chronicle* for December 5, Mr. Withers asks whether *Primula nivalis* of Pallas is found in Dahuria, and whether it is known in English gardens, and invites me to answer the question. He rightly supposes that the European alpine Primrose, with white flowers, often sold in nurseries as *P. nivalis*, has no right to that botanical name. *Primula nivalis* of Pallas, discovered by that botanist in Siberia at the end of the last century, has been and I believe still is in cultivation at Kew, and I have had both seed and plants from that source. It has, however, disappointed me, not having proved ornamental, or in any respect superior to the far more common *P. denticulata*, some forms of which it resembles. But *P. nivalis* is a very variable plant, having a wide geographical range, which extends from the high mountains in the North of Asia Minor, across the Caucasus, and along the mountains which separate the Russian Empire from the Chinese, reaching nearly to the Pacific coast, and occurring both north and south of the Amoor. About a year ago, I looked through a large series of *P. nivalis* in the Kew herbarium, and the flowers

seem to get finer as the species extends eastward. A very beautiful form, with large flowers of imperial purple, is figured in Regel's *Gartenflora*, by the name of var. *Turkestanica*; but though seed of this variety has been offered in England, I never heard that it has been successfully raised here. I believe the Kew stock was from the Caucasus, where E. Boissier (*Flora Orientalis*, vol. iv.), describes it as growing amongst masses of ice (moles glaciales) at an elevation of from 6000 to 10 000 feet. It probably owes its name to the snowy height at which it flourishes rather than to the colour of the flowers, which is usually purple, though rose-coloured and white varieties occur. Its nearest European relations are *P. longifolia* and *P. farinosa*. Mr. Withers calls *P. nivalis*, "Fischer's Primrose." The only Primrose of that district which I find in the Kew Catalogue connected with Fischer's name is a variety of *P. longiscapa*, a species having partly the same range as *P. nivalis*, though distinct from it, and said to extend into Dahuria. *C. Wolley Dod, Edge Hall.*

HEAVY PITMASTON DUCHESS PEARS.—Observing in recent numbers of the *Gardeners' Chronicle* paragraphs concerning the weight of the above Pear, I wish to add my note of information to the others. We have here a tree which bore last year twenty-two fruits, of which the six largest had the following weights:—Two fruits, 1 lb. 10 oz. each; two ditto, rather over 1 lb. 9 oz. each; one ditto, 1 lb. 8½ oz., and the other, 1 lb. 8 oz.; total, 9 lb. 6½ oz. The rest were very fine fruits, the smallest weighing 1 lb. This present year the same tree bore fifty-four fruits, which averaged 1 lb. each. My employer, who is a good judge of fruit, pronounces them to be in flavour and appearance, first-class. *G. Mobbs, Gardener, Becklands, Great Grimsby.*

STANDS FOR THE EXHIBITION OF JAPANESE CHRYSANTHEMUMS.—I agree with Mr. J. Douglas in his remarks in the last week's issue of the *Gardeners' Chronicle*, respecting the size of stands for the showing of Japanese Chrysanthemum blooms. Now that these Chrysanthemums have grown to an enormous size, the various Chrysanthemum societies will do a good service to exhibitors if, before they frame their schedules for next season, they will extend the size of stands for twelve blooms to 28 by 22 inches, as recommended by Mr. Douglas. At almost all exhibitions of Chrysanthemums complaints are heard respecting this matter, and in my humble opinion, these are not without foundation. Doubtless judges of blooms at shows will appreciate such an alteration of the size of stands as much as the exhibitors themselves, as it must cause them more trouble to examine the blooms when these are crowded together than would be the case if they were allowed more space. *R. Milner.*

A REMEDY FOR THE EUCHARIS MITE.—If "W. A. S.," who enquired for a means of ridding his bulbs of the mite, will procure some of Chibran's Eucharis Mite Killer and use it as directed, I think he will soon be rid of these troublesome pests. I have used it for some time and with the best results, as our stock, which was at one time badly infested, is now quite clean and healthy. *T. Spencer, Goodrich Court Gardens, Ross.*

HARDY CYCLAMENS.—In reply to Mr. G. F. Wilson's inquiry respecting the growing of hardy Cyclamens, I may say that we have them growing here in three different situations, namely, at the foot of Oak trees in turf, also amongst limestone rocks shaded by overhanging trees, and in the open; and I find that those growing in the open beds are more compact, and less drawn, and the blooms a little finer than those growing under the shade of trees, but with these exceptions, I find that those growing under shade, flower quite as freely as those growing in the open. The soil in which they are growing is a light sandy loam, overlying limestone rock, and we are situated within 1 mile of the sea, and at an elevation of from 70 to 80 feet above sea level. *R. Milner, Penrice Castle, Swansea.*

THE CLIMBING VARIETY OF NIPHETOS ROSE.—Your correspondents in the *Gardeners' Chronicle*, p. 651, evidently do not seem to have understood my letter of the previous week, or, perhaps, I was not sufficiently explicit. I intended to convey the fact, that there need be no doubts whatever as to there being a climbing Niphetos Rose, as even the old variety will climb far enough to suit some requirements. I further remarked that I had not observed a good plant of the climbing variety.

I did not convey the idea (at least I did not think so) that there were no good plants. I merely stated the fact that I had not seen one. I have heard of good plants and some day I may be able to see one. I have propagated plants from the old stock, as Messrs. Keynes terms it, and have found that when the plants are well established they assume a sort of climbing habit, but not to such an extent as to merit the term "climbing Rose." I speak of propagation from cuttings. I have had very good plants in six months from cuttings taken off in the spring. *W. A. Cook, Compton Bassett.*

CHRYSANTHEMUM MRS. ALPHEUS HARDY.—Whilst looking through the plant-houses at Hill Carr, Bowdon, a few days since, I was much struck with a beautiful example of *Chrysanthemum Mrs. Alpheus Hardy*. I was informed by Mr. Tibbles, the gardener, that the plant in question was propagated late in the spring of last year; it was grown on in an 8-inch pot, and in due time produced fine small flowers. Last spring this plant was placed in a cool Azalea-house, where it has remained ever since. It was kept in an 8-inch pot till the beginning of August; the plant was then shifted to a 12-inch pot, and liberally treated, and it produced a number of branches which were carefully trained to wires on the roof of the house, and in close proximity to the glass. It has produced forty-five beautiful flowers, measuring from 5½ to 8½ inches in diameter, and of a good depth, very pure in colour; the hairs on the petals, too, were well developed. This was the most striking specimen of a *Chrysanthemum* that I have seen this season. I enclose two flowers. *H. Ellis, Bowdon.*

MAMMOTH CHRYSANTHEMUMS.—It is hardly possible to find for some of the Japanese Chrysanthemums of somewhat recent introduction a more appropriate appellation than that of mammoth. It is sincerely to be hoped that in *Etoile de Lyon*, probably the largest of all the section, we have reached the maximum of size, although some few others run it very close. With, perhaps, one special exception—that of *Viviani Morel*, which is, probably, the best of all recently-introduced Japanese varieties, the more newly introduced large-flowered sorts are of no very special value, except so far as size may be an element of admiration, when *Etoile de Lyon*, Mrs. E. W. Clarke, Stanstead White, Mrs. C. H. Wheeler, or Mrs. Falconer Jameson come into the stands. Of other ordinary and probably even-sized flowers, they not only spoil uniformity, but add nothing to average excellence; rather, perhaps, the addition of these large flowers tends to dwarf others, and so make the stands to appear less meritorious than they really are. Judges should certainly lay some stress upon evenness [they generally do so. Ed.] which the introduction of one or two big blooms into a stand of twelve flowers helps materially to destroy. Mere size is not quality—indeed, many of the large blooms are coarse. Then their inclusion in stands, because these stands are made expressly for flowers of average dimensions, helps also to cover or injure the other flowers. It is very evident that only the use of large stands will enable these big flowers to be adequately displayed. It may be worthy the attention of Chrysanthemum show committees to consider whether it is not well to establish a class for these largest blooms, and thus attract these giants from their ordinary classes. The result would materially be helped if judges were specially invited to make average evenness of size in the flowers an important element in making the awards. *A. D.*

BURNT EARTH IN THE PROPAGATION OF PLANTS.—Some time since your columns contained remarks from various correspondents concerning the uses of burnt earth in plant-culture, so that the following, which I came across recently in the *Floricultural Cabinet* for the year 1844 p. 43, will most likely prove of interest. It is headed, "On Striking Cuttings in Burnt Clay":—"Having been very successful in striking cuttings of nearly every kind of stove and greenhouse plants, I have in my collection (which consists of most of the usual handsome-flowering, shrubby kinds) in burnt clay. I am induced to recommend the plan to others. Burnt clay has the property of absorbing ammonia from the atmosphere, which affords a constant and regular stimulus to the cuttings, and enables them to send out the radical fibres very quickly. *G. S.*" Whether the more rapid emission of roots by the use of burnt earth is an established fact, I cannot say [Yes, in our experience. Ed.] but I can testify to its value among alpine, and also in the kitchen garden, and by its

sparse use in gardens generally, I am fully convinced that we are constantly setting aside a very useful and valuable agent in all that pertains to the garden and farm. J.

A PLEA FOR THE UNLUCKY GARDENERS.—

There can be no two opinions as to the craftsman with theoretical and practical knowledge having an infinite advantage over the craftsman with practice only, and so I cordially agree with all that has been written from time to time concerning the careful study of good books, of evening classes, and social gatherings, with a view to the encouragement of recording experiences, and exchanging ideas. It is, however, rather hard on the poor gardener who is out of place, and often through no fault of his own, to brand him as an ignoramus, and to say that his present unhappy position is due to his past neglect to read, mark, and learn. As an old traveller, I have again and again come in contact with those persons who perpetually complain of the lack of good gardeners and all that sort of thing, and secretly know them to be exacting and merciless creatures, whom no man could satisfy and please. I know some of them, too, as individuals who have risen in the world by leaps and bounds, and they, having escaped the woods, of course, can whistle. We are all of us, I fear, apt to forget in prosperity the days of our adversity; and here I can lay it down as a fundamental fact, that it does not always follow that learned gardeners command all the best places. I can, and do, speak with some authority on this point, because, for many years, I had charge of the gardeners register at the great Exeter Nursery, from whence eminent gardeners have been scattered far and wide, and I have often proved that an ordinary gardener, possessing tact and influence, generally did well. It is, of course, equally true that a gardener having tact and influence, together with theoretical and practical knowledge, would stand a chance of doing still better, apart from the old saw, that once a man having gained the reputation for early rising, may lie in bed all day; and so I quite expect that the "men of mark" mentioned by Mr. Huxford owe their distinction in a large measure to tact and position. For instance, there would have been no Sir Joseph Paxton had there not also have been a Duke of Devonshire; and my late lamented friend, John Dominy, would probably have gone down to his grave a poor obscure Devonshire gardener, instead of an Orchid specialist and hybridiser, but for the great house of Vetch. If space permitted, I could cite plenty of similar parallels; and also of the clever gardeners who, through the tangled skein of causes, have been driven out of the profession altogether, to seek refuge in petty husbandry; others as greengrocers or publicans, and not a few, alas! into the poor-houses. I am often grieved to see the intellectual men who haunt the London nurseries for berths, or even temporary employment as garden labourers. W. Napper, Chelsea.

VIOLAS v. TUFTED PANSIES—Should *Violas* be called Tufted Pansies? This is a question regarding which I thought it would be well, some time ago, to endeavour to elicit an opinion which would be authoritative for everyday use, and, therefore, I wrote to a number of the most noted trade and private growers, asking an expression of opinion on this point. In every case, with one exception (Mr. T. S. Ware), the term was disapproved of, and the great majority expressed themselves in favour of retaining and using only the old name of "*Viola*." The letters speak for themselves, and your readers will, no doubt, have pleasure in perusing them, seeing they are all from well-known growers. Wm. Cuthbertson, of Dobbe & Co., Rothsay.

"We are strongly of opinion that *Violas* should still be called *Violas*. Any attempt to alter the name to Tufted Pansies—a most misleading name—will never meet with our support. R. B. Laird & Sons, Edinburgh."

"I cannot see why the name should be changed from *Viola* to Tufted Pansy. I think the words "Tufted Pansy" are quite misleading, and cannot understand how they have ever been used. *Viola*, I consider, is the proper name, and anyone with a knowledge of Pansies knows very well that a *Viola* is quite distinct from either a show or fancy Pansy. John Downie, 144, Princes Street, Edinburgh."

"In answer to your enquiry, we are of opinion that the name 'Tufted Pansies' is misleading. There is no such name. It originated, we think, in the mind of the editor of the *Garden*. Bedding Pansies and *Violas* are now so much crossed and

mixed up with each other, that the only proper name is Bedding Pansies and *Violas*, or, if preferred, Bedding *Violas*. We shall never call them Tufted Pansies in our lists. James Cocker & Sons, Aberdeen."

"We think *Violas* the simplest name, and the one they are best known by. Paul & Son, The Old Nurseries, Chesham."

"May I suggest the term 'Bedding Pansies' be adopted in preference to either of the above (*Violas* or Tufted Pansies). I do not like the word 'Tufted,' and am of opinion that by distinguishing them as bedding Pansies, it would tend more than ever to popularise them for that purpose, to which they are so eminently suitable. George Phippen, F.R.H.S., Reading."

"I have always condemned the use of the words 'Tufted Pansies' to our *Violas*, as misleading and incorrect, and my strong condemnation in my various communications to the gardening press is proof of my disapproval. The botanical aspect should be left out of the question. William Dean, Sparkhill, Birmingham."

"I think you are doing a good work in trying to settle the question you have in hand. I should certainly say Tufted Pansies is at once a far more descriptive and common-sense term than *Violas*, and much more likely to be properly understood by the general public. Thos. S. Ware, Tottenham."

"I have always considered Tufted Pansies a nonsensical name, as many of them are not tufted in growth at all. W. E. Gumbelton, Belygrove, Queenstown, Ireland."

"O save thee ancient manner

From the friends that plague thee thus."

I am always delighted to applaud anything praiseworthy in our young florists, but in this case we are reminded of the dictum of Solomon, 'He that spareth the rod, &c.' In short, the term 'Tufted Pansies' would not accurately describe the habit of some of the best *Violas*, as some of the varieties are somewhat straggling, 'not tufted' in growth. As *Viola* has a sweeter sound, is distinct from Pansy—as the flower also is; and looking at the matter broadly, I see little to warrant the change of name. John Baxter, Daldozie, Broadhouse, Glasgow."

"I am in receipt of your favour re 'Tufted Pansies v. *Violas*.' I object to the former name as being inaccurate in two particulars. *Violas* are not Pansies, and are not, with the exception of half-a-dozen varieties—tufted. While all Pansies are *Violas*, no *Viola* except tricolor, and such as have been derived from it, is entitled to the name of Pansy. The question as to whether *Violas* not 'tufted'—or stoliferous—in habit are descended from *V. tricolor* is quite another matter. J. D. Stuart, Newforge House, Malone, Belfast. P.S.—Besides the reason assigned, my old-fashioned conservatism clings affectionately to the old and simple name of *Viola*. It a new name is to make headway and become popular, it must have something either in sense or sound to give it a 'boom.' Now I think the new name does not fill the bill in either of these particulars. J. D. S."

"I prefer the original designation, namely, *Viola*. 'Tufted Pansy' is both misleading and inaccurate. Captain J. A. King, Glazert Bank House, Lennoxton."

"If it is purely a question of giving the flower its right name, I do not see why the word 'tufted' should be introduced at all. Henry Hamilton, Lochwinnoch."

"I am strongly in favour of the use of the term '*Viola*,' and think that the term 'tufted Pansy' is neither attractive, descriptive, nor harmonious, and should be discarded. All our Pansies are *Violas*, according to the genus, and the nearest relation, and least removed from the wild types, is the *Viola* of commerce; next in relationship comes the fancy Pansy, and after that the show Pansy. If we stick to the hard and fast rule of their natural order, we would leave out the term Pansy altogether, and name the three types in the following order, *Viola*, fancy *Viola*, and show *Viola*. The terms show Pansy, fancy Pansy, and *Viola*, have been used without comment, until the recent term, 'Tufted Pansy,' crept in. If *Violas* were all tufted in habit, we might retain the term, but in named varieties not one in twelve is tufted. Like most young growers and writers on the subject of Pansies and *Violas*, I have been using the term tufted Pansy recently, and from older and more experienced growers I have had threatening letters, two being particularly noticeable—one from Birmingham, and the other from the land of the 'Immortal Dan.' George McLeod, F.R.H.S., Chingford, Essex."

SCOTLAND.

SCOTTISH HORTICULTURAL SOCIETY.

The monthly meeting of this Association was held in the Rooms, 5, St. Andrew Square, Edinburgh, on Tuesday evening, December 1, 1891, the President, Mr. W. M. Welsh, in the chair. After the usual preliminaries, a number of new members (including five life members) were proposed and elected, a fact which testifies that the interest in the Association is in no way diminishing. A paper, the subject of which was "Gardeners and Gardening: North v. South," by Mr. J. Muir, Margam Park, Wales, was, in the absence of the writer, read by Mr. Robert Laird, Secretary of the Association. He paid a high compliment to the Scottish Horticultural Association, assuring its members that there was no other similar, of equal merit, in the many institutions he knew in the South. He regretted being unable to be present to read his paper, and asserted that no country in the universe produced such qualified gardeners; this was admitted by impartial judges, and it was equally admitted that Scotsmen must "come over the border" to become fully qualified; that the leading gardeners in Scotland are indebted to their sojourn in the South for a great amount of their eminence.

The home-made Scots gardener is, as a rule, too self-opinionated to be an agreeable success, and requires experience and a "widening of associations" to qualify him as a perfect gardener. He advised young gardeners in Scotland not to lose sight of gaining experience in the South, they acquire in addition to an insight into their profession, culture of manner, and language. He had a difficulty in deciding which was the least worth, an English or Scots apprentice, when just out of their time. The Scots journeyman was an adept at digging and outdoor-work, the English mainly indoor, and in choosing a beginner he had a decided preference for the spade hand, as he asserted that the knowledge of handling a spade and power of performing hard work had secured for Scots gardeners the eminence they have attained elsewhere. In Scotland and the North, where one instance of the means exists for gardeners to perfect themselves in all kinds of under-glasswork, in the South there are twenty, and it is only in the combination of the two experiences that the young Scotsman can hope for success in life, and it is only when his ambition is fired by what he sees in the South that he can hope to shine as a gardener, and then he rarely makes the mistakes common to Englishmen, of indulgence in frivolous company and amusements. Scotsmen are not often found in single-handed situations in England; he is more ambitious, and in this respect many young English gardeners are left behind. Head gardeners are well aware of the advantage of having a trustworthy and industrious man, which he finds in the young Scotsman, who thereby secures a leading position amongst young gardeners, who often secure good places in England, and only return to the old country when they are assured by their experience in the South of a position both as gardeners and as members of the community.

The southern gardeners are better decorators than the northern, and many admirable cultivators in the latter are not able to display their produce to equal advantage with the former. Dinner-table and other decorations are greatly neglected in Scotland, and northern gardeners, with other excellent abilities have failed to give satisfaction to southern employers. England far excels Scotland in its exhibitions, from a southern point of view. The Royal Caledonian Horticultural Society is not credited with perfect management—quite the reverse, although regarded as the leading Society in Scotland, there are many admirable men on the committee who fail to assert their rights, and allow their duties to be monopolised to a great extent by one or two members, and the result is, the show is regarded as a partisan one. They would not tolerate anything of this kind in the South; the Scotch shows are not regarded in the South as patterns, and they had

nothing to learn from them, although the facilities in the North are second to none.

Much superb produce seen in England is never seen in the North, and *vice versa*; England excels in specimen-plants, Scotland in Grapes and vegetables. In plant culture England has no equal, and they have a more ardent love for flowers than the Scotsfolk, which it was to be hoped the Associations in Scotland would use efforts to alter, and foster a desire for flowers and gardening.

The economy of the South in their gardens was greater than in the North, the huge kitchen gardens from which only one crop a year was obtained in Scotland, are almost unheard of in England, where successional crops are the rule, and this all-the-year-round supply system interests the cultivators and gives general satisfaction. The walls in the North are generally so well managed, that the Scots gardener misses them in the South, as in the training of fruit trees Scotland sets an example to the world, and it is a telling qualification.

The Royal Horticultural Society of London has no parallel in Scotland, to its deliberations and management all who patronise horticulture are greatly indebted. By its rules, new or old productions claiming distinction must be tested under the most practical supervision before being recommended to the public, and the "weeding out" in this way is a benefit of the greatest magnitude to growers. It is remarkable how few new and meritorious plants, fruits, flowers, and vegetables appear there and win distinction from Scotland. This is to be attributable to the disinclination of the northerners to improve the different forms of vegetation, as it cannot bear the construction of inability. The deficiency of Scotland in horticultural literature was dealt with at some length, and was pointed out as a weak part of the system of horticulture that could be remedied. Scots gardeners in England were always anxious to be informed of the progress of Horticulture in Scotland, which he thought, would never be thoroughly done from London. After remarks upon the nursery and seed trade in Scotland, and their travellers, the paper concluded that much of interest had been left unsaid, but while Scots gardeners can very well hold their own against all comers in Scotland, their professional countrymen in the South were a highly respected class of men; their positions are partly accountable for this form, but the proverbial honesty of character and their persevering disposition are the qualities which secure for them the greatest distinction.

The paper caused considerable discussion, and was on the whole well appreciated, although some members were inclined to resent what they thought a too great freedom of the privileges of a paper not read by the author. The Chairman, proposed a hearty vote of thanks to the writer, whom he described as an excellent Scotch gardener of a modest and even retiring demeanour, and if he had found fault, he had also patted them on the back, which the large assembly quite willingly accorded.

A fine collection of American Apples, consisting of forty-four dishes, were exhibited, sent by the Director of the Government Pomological Department, United States of America, as a fair sample of the Apple produce in several of the States, of which Peck's Pleasant, Ben Davis, a highly-coloured and excellent fruit, varying very much in the size of its fruit in the different examples shown from three States; Baldwin, Roxburgh Russet, Northern Spy, Pomone Gris, and others were fairly good examples, and were commented upon as not equal to the pick of the Canadian examples of the same sorts sent here for sale in the markets.

A vote of thanks to the Chairman closed the meeting, which was largely attended.

ROYAL CALEDONIAN HORTICULTURAL.

The annual meeting of the Royal Caledonian Horticultural Society was held in Dowell's Rooms, Elinburgh, recently, Mr. D. P. Laird presiding. The accounts for the year ending November 30 were submitted by the treasurer, Mr. P. Neill Fraser, and

showed the receipts to have been £2281 8s., and the expenditure £2337 10s. 4d., the latter including £906 as expenses for the spring and international shows, and £1,324 11s. 6d. in premiums at those shows. In addition to the money prizes, plate to the value of £57 13s. was presented to successful competitors by nurserymen and others. The capital value of the funds at date was £1174 1s. 4d., being a decrease of £68 5s. 2d. on the previous year. Mr. Welsh, in moving the adoption of the report and a vote of thanks to the treasurer, said the statement just submitted was a very gratifying one. The decrease in the funds was very small, considering the great show that had been held in September, and which had given a stimulus to horticulture which more than compensated for the slight diminution of the funds. Mr. William Young stated that there was not another horticultural society in Britain that paid so much in prize money as the Royal Caledonian. The report was adopted. Colonel Wauchope, of Niddrie, was elected a vice-president of the society, in room of Lord Melville, who retired by rotation, and two members of council were appointed. The chairman mentioned that the society had arranged to hold three shows next year—in the spring, summer, and autumn; and they had every reason to hope that the year would be as successful as in the past, and that the society would continue to maintain the premier position. Mr. Macmillan and Mr. D. Thomson were elected members of the council.

GLAMIS CASTLE GARDENS.

These gardens have many features, the splendid collection of Conifers being particularly noteworthy. Probably, however, Glamis Castle Gardens are most famed for the production of fruits under glass. On visiting them this autumn we were agreeably surprised to find some old Vines carrying capital bunches of Grapes, the Muscat Hamburg being in very fine condition. Lady Downe's, Muscat of Alexandria, and Madresfield Court, were equally good. Some recently-planted Gros Colmar and Muscat of Alexandria Vines had made vigorous, short-jointed growth, which cannot fail to give grand results. At each end of these vineries are two Peach-houses, filled with well-trained trees. Mr. Whitton, the gardener, spoke very highly of Red Magdalen, Sulhamstead, Hale's Early, Dymond, and Walburton Admirable, also Pittmaston Orange and Elruge Nectarines.

A collection of Figs is being made, and many sorts are now under trial, both in pots and planted out. Several houses are also devoted to Melons; these structures are wide, three-quarter spans, and give very satisfactory results. The only variety grown is a sort raised at Glamis Castle, and named Lord Strathmore; it is a fine-sized fruit, rather flattened, and somewhat ribbed, of the scarlet-flesh section.

Many houses are devoted to the culture of decorative plants, Orchids, &c. Carnation; Souvenir de la Malmaison was in grand form, and amongst other subjects were huge batches of Dracenas, Kentias, Asparagus tenuissimus, Begonias, Crotons, &c. Some well-grown zonal Pelargoniums were carrying a fine crop of flowers, the double kinds being most liked for cutting. Two very striking double sorts were Florence, a pure white, with a fine compact habit; and Jules Simon, pink. Clerodendron fallax was exceptionally well done. The plants had been raised from seeds sown in spring, and were growing in 5-inch pots; each plant had a finely-developed panicle of flowers, about a foot through, and rather more in height. This subject is treated strictly as an annual, and this appears to be the proper mode of cultivation of it. Among other things, we noted fine examples of Alocasia Sanderiana, A. Lowii, Andromeda metallica, Anthurium crystallinum and A. Veitchii, Tillandsia Lindenii, and of the variegated Ficus elastica. Pitcher Plants are also well-grown, especially Nepenthes edinensis, N. Findleyana, N. Lawrenceana, N. Mastersii, N. Rafflesiana, N. Harkeriana, and most of the leading sorts. In the conservatory the old Fuchsia fulgens bore many drooping corymbs of its bright red flowers; Cassia

corymbosa was almost smothered with its yellow flowers.

Cool Orchids were also very well grown, especially Masdevallias. Odontoglossums were also well represented, especially the crispum section, of which there were many fine varieties. Masses of O. grande, Miltonia vexillaria, Oncidium tigrinum, Sophronites grandiflora, Coelogyne cristata, and Cypripedium in variety, were likewise noticeable. In another house, Dendrobiums, Cattleyas, Lælias, Vandas, and the warmer Oncidiums, were skilfully arranged to suit their requirements.

Considerable attention has been given to Apples and other hardy fruits, but comparatively few varieties seem to be really worth growing here; as cordons, however, several varieties do exceedingly well—notably, Warner's King, Duchess of Oldenburg, Stirling Castle, Northern Dumpling, Cellini, Lord Grosvenor, and Lane's Prince Albert. As orchard trees, Aitken's No. 2, Beauty of Moray, Keswick Codlin, and Tower of Glamis, are by far the most satisfactory. With the exception of some of the earlier and older sorts, Pears are not often a satisfactory crop. *F. R.*

ANORÆCUM EDURNEUM.

In nearly every collection of Orchids the above plant is to be found, and it is therefore not with any intention of introducing a novelty that I make a note of it. It is not everywhere, however, that one sees a plant similar to that owned by Bailie McDonald, Ardrossan, N.B. The plant to which I refer is a splendidly-cultivated specimen, which reflects credit on Mr. Murray, the grower. The plant stands about 4 feet out of its pot, and is composed of eighteen pairs of fine strong leathery leaves, which are so closely and evenly grown, that not the slightest particle of light is discernible between the foliage; just now the plant has four stout flower-spikes, heavily laden with rich ivory-white blossoms. Other kinds of Orchids are equally well grown, and one of the finest forms of Odontoglossum grande is enlivening the conservatory. Dendrobium Phalænopsis is well represented by three well-flowered spikes, and a huge mass of Lælia albida, with nineteen flower-spikes, is noteworthy; the latter is growing in stove temperature. Of Cattleyas, many fine forms of Trianae, Mendelii, Mossie, and others, are now making good sheaths. Odontoglossums are grown well in a lean-to Peach-house, which, though rather lofty for its present use, suits the requirements of the plants perfectly, and many fine strong bulbs are being made. *Scottie.*

THE ROSERY.

WORK IN THE ROSE GARDEN.

ALTHOUGH the operations to be performed in the cultivation of out-of-door flowers are very much the same from year to year, yet the character of the seasons makes a considerable difference sometimes in the period, and at other times in the manner, in which they are done. For instance, I hardly recollect, except perhaps in that woeful year, 1879, a season when the necessary operations in the Rose garden have been so long delayed. The excessive wet of the month of October had a two-fold effect—it prevented the nurserymen from lifting their plants, and when their orders were executed, it prevented those who ordered them from planting. For weeks the ground was in such a state, owing to the excessive rains, that it was impossible to get upon it, and it has been, in consequence, one of the most trying seasons for nurserymen that they have experienced of late years. Writing at the end of October, one wrote to me, saying, "I had just begun lifting my Roses, and when they were raised, the same cause militated against putting the plants into their position in the Rose garden, for it is much better to delay this for weeks even, rather than to plant when the ground is in an unfit condition; consequently they have been just 'laid in' until a suitable time comes."

I have every reason to be satisfied with the results of the plan I have adopted of late years, viz., that of cutting out the old flowering wood, and leaving only those strong shoots which form the hope of the next season. Two objects are secured by this—the operation of pruning in the spring, when there is so much work to be done in the Rose garden, is considerably lessened, and the wood gets more thoroughly ripened, which is a most important factor in successful Rose-growing. Of course, this does not apply to Tea Roses, which had better be left alone. It is still a moot point whether these require much pruning; there are many very successful growers of Tea Roses who say, do not prune them at all, but merely shorten the shoots. Tea Roses keep going on much later in the autumn than the H.P.'s, and consequently there is a considerable quantity of soft unripened wood, which in severe winters is sure to be cut up by the frost, but in mild winters will remain fresh and green. I do not think we should be deceived by this, but cut it away, leaving the heads to start afresh for the year's growth.

In planting, I am more and more persuaded it is well to avoid mixing up manure with the soil, and that the best way is to take out (where the beds are to be replenished) the old soil, loosing that in the bottom of the hole, then placing some rotted turf (the top spit of a pasture where the soil is good is the most suitable); this should be well chopped up with a spade, and the roots evenly distributed when planted, and then pressed firmly down. I have said the turf should be taken from a pasture where the soil is good, for some people seem to have a notion that, provided they get the top spit, this is of no consequence. This is a great mistake; the rotted turf is a good thing, but it is of importance that the soil be such as the Rose delights in.

In ordering Roses to replace those which it is decided to weed out, the question will come before the amateur, "On what stock shall I have my plants?" The answer to this question must be regulated by the situation of the garden, and the character of the soil. There has been of late quite an onslaught on the Manetti as a stock. Everything that was bad was said of it; its days were numbered, it would soon be a thing of the past, and such like Cassandra-like prophecies were freely indulged in. For all soils and situations, the seedling Briar or the Briar cutting was recommended. Now we are as a nation fond of running into extremes, and from being extolled to the skies, it has now become the fashion to denounce the seedling Briar; but there are some things in its favour. In the first place, it is an early stock; the sap begins to rise early, and this causes the Rose budded on it to start early. Now where a grower who desires to exhibit lives in the colder or less favoured parts of our islands, this is a great boon. We have seen how the Messrs. Harkness, of Bedale in Yorkshire, have more than once carried off the Challenge Trophy at the National, and their plants were on the Manetti; so that for all districts north of the Trent and in the Midlands, I believe it to be a most valuable stock, while it would be simply impossible to propagate new varieties without it. Then it is, I think, better suited for light soils than the Briar. We all know that the wild Rose revels in the clayey loam of our woodlands and hedgerows, that it pushes its way with fleetness through great depths of soil, and then flings its branches overhead laden with its chaste lovely flowers; but it does not flourish so in our lighter soils—its roots are few, while the Manetti is furnished with an abundance of them, and so in a light soil these roots are able to draw a larger amount of nourishment from the soil around. I do not mean to say that the stock will not thrive in stiff soil; some of the finest plants I have ever seen at Mr. T. B. Hall's, at Larchwood, Rockferry, were on this stock. When we praise the Manetti, we are told, "Oh! but the Roses have got on their own roots." Perhaps so; but is not this an advantage? when budded low, the point of junction is buried, the Rose will soon emit roots, and thus the plant has a double chance. There is one thing about which caution is needed. There are some varieties of H.P.'s which have a good deal of Tea blood in them, Captain Christy,

La France, Lady Mary Fitzwilliam, &c.; these ought never to be budded on the Manetti, but, like the pure Teas, be given to the fostering care of the Briar. I have been told that the Manetti is short-lived, yet I have a couple of plants of *Souvenir de la Malmaison* budded on this stock which are now forty years old. They are pruned hard every year, and every year, especially in autumn, they give me an abundance of very lovely flowers. Its great defect is its habit of throwing up suckers from below the junction, and this has to be carefully watched against, for unlike the Briar, the foliage is very similar to that of the Rose, and hence one often hears from inexperienced hands, "I cannot understand why this Rose will not flower. It grows most vigorously, but I cannot get it to bloom." On examination it has been found that instead of a Rose, he has got a most sturdy bush of Manetti.

In planting Tea Roses where the situation is low and the soil heavy, the best plan is to raise the beds over the ground-level some few inches or so, just as is done in Potato culture on what are called "lazy beds" in Ireland; but it is questionable whether, in such situations, Tea Roses will thrive, for although I do not agree with the assertion of many successful growers of this class of Roses, that it is useless to try and grow them unless the garden is some 400 feet above sea-level. This observation, I think, arises from experience in the wet and damp West of England, and not in the dry climate of the Eastern Counties; yet there can be little doubt that they do prefer a dry situation, and one where the roots are not water-logged.

Although I have deprecated the mixing of manure with the soil when planting Roses, I am a strong advocate of the liberal use of manure in mulching, and this is better done at this time of the year, *i.e.*, when it is more the desire of the grower to have his garden neat in appearance than to obtain large exhibition blooms. I find it best to throw a little earth around the neck of each plant before laying on the manure, which should be done very liberally, say, to the depth of 6 inches, and letting it remain on the beds all the winter, preventing the frost from reaching the roots. All the fertilising salts are washed down by the winter rains, and then in the spring all the long strawy part is raked off, and the short portion gently forked in. This long stuff I found very good for laying up in a heap and planting Vegetable Marrows upon; there remains a certain amount of heat in it, and the plants start off rapidly.

I find it to be a good plan to somewhat shorten the long shoots before the winter, cutting off a foot or so, so that they are not so easily caught by the wind; and, as they are also somewhat steadied by the mulching, it obviates the necessity of staking them. With these precautions, our Roses are, I think, well equipped for enduring the winter storms. *Wild Rose.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 8.—For the last meeting of the year, there was an unusually fine display of bloom at the Drill Hall, Westminster, but the attendance was rather thin. Orchids formed the principal feature, the collections shown by Sir Trevor Lawrence, M.P., Messrs. Sander & Co., Collins & Collins, and Pitcher & Manda, being very fine. These are referred to at length elsewhere. Late-flowering Chrysanthemums were also well represented; but those who visited the exhibition for the purpose of seeing Hellebores must have been disappointed. A few clumps in pots were staged by various firms, but they were not so numerous as was generally expected. Owing to the unavoidable absence of Canon Ellacombe, too, the lecture on "Hellebores" was postponed.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Laing, H. Herbst, B. Wynne, R. Dean, T. Baines, H. B. May, F. Ross, W. C. Leach, C. Jefferies, G. Phippen, H. H. D'Ombraim, C. E. Pearson, J. Walton, J. B. Poë, H. Turner, C. Noble, W. H. Williams, H. Cannell, G. Paul, and W. Furze.

Chrysanthemums were the principal feature in this section, and the collection exhibited by Mr. Owen, Maidenhead, attracted much attention. Most of them were new English-raised seedlings and American varieties, and many of the blooms were noteworthy for their size and freshness. The most conspicuous was a massive bloom of a Japanese incurved seedling named Robert Owen, said to be a cross between Sarah Owen and an American variety. The flower was of gigantic proportions, and a pleasing golden bronze colour. Among other varieties in this collection, the most noticeable were Lizzie Cartledge (Japanese), pale pink centre, deep rose edges, and silvery reverse; Peter Blair (Japanese), yellow, striped reddish crimson; Mrs. Gladstone (Japanese), creamy-white, sulphury centre; Mr. John Frith, Japanese incurved, of a pale pink colour, and hirsute petals in a slight degree; Rivelyn, a capital incurved of a golden bronze colour; and Thomas Selwood (Japanese), yellow.

Mr. Wells, Earlswood Nurseries, Redhill, also showed an interesting collection of Chrysanthemums, many of them being single varieties. The flowers of the latter were fresh, and of a useful decorative size, affording a fine contrast to the double blooms. These single Chrysanthemums might with advantage be more generally grown.

Chrysanthemum blooms were also exhibited by Mr. W. Whiteley, the Nurseries, Hillingdon, this collection comprising good examples of Princess of Teck and Mrs. Norman Davis. Mr. E. S. Willis, The Gardens, Elgicote Park, Banbury, also sent flowers of a white Chrysanthemum sport from Etoile de Lyon, but it did not appear to possess any noteworthy merit. Mr. G. Wythes, Syon House Gardens, showed blooms of an apparently useful white Chrysanthemum, named Duchess of Northumberland. Mr. C. Ross, Welford Park, Newbury, sent a Chrysanthemum Mrs. Pethers, with a sport in bloom growing from it; and Mr. Simpkins, gr. to R. Measures, Esq., Camberwell, staged a flowering branch of an imported Chrysanthemum named Mrs. H. Simpkins. The flowers of the latter were yellow, and of a feathery character. From Messrs. Pearson & Sons, Chilwell Nurseries, Nottingham, came blooms of Chrysanthemum, E. G. Hill, a fine golden yellow.

Hellebores were shown by Mr. T. S. Ware, Tottenham, who also sent several pans of *Narcissus monophyllus*, a useful subject for forcing. Iris *Histrio*, a charming little thing for winter flowering was also exhibited by the same firm. Messrs. R. Veitch & Co., Exeter, sent a fine clump of *Helleborus niger* major in bloom; also one or two other varieties. The flowers of the former were large, and of a pure white colour.

A small collection of *Begonia Winter Gem* came from Messrs. J. Veitch & Sons, Royal Exotic Nurseries, Chelsea. The plants were small, but well-flowered, and afforded ample proof as to the usefulness of this variety for blooming during the winter. The same firm also sent cut blooms of hybrids of *Rhododendron javanico-jasminiflorum*, amongst which Duchess of Connaught, Princess Royal, Scarlet Crown, and Princess Alexandra were the most conspicuous.

Mr. W. Iggulden, Marston Gardens, Frome, sent bracts of a seedling *Poinsettia*, and Mr. C. Turner, Slough, *Poinsettia* major, but in neither case could any distinct improvement on the type be seen. *Adiantum Rochfordi* came from Mr. T. Rochford, Turnford, Brockham; Mr. L. Duval, Rue de Ermitage, Versailles, sent plants of *Vriesia cardinalis*; and Messrs. Pitcher & Manda, Hextable, sent *Zamia integrifolia*.

Messrs. Cannell & Sons, Swanley, had *Primulas* in pots, and flowers of *Leonotis leonorus*; and from Mr. A. Waterer, Woking, came sprays of the Knap-hill Oak, a scarlet-foliaged kind of remarkably rich colouring. Messrs. Paul & Sons, Cheshunt, sent specimens of a winter-flowering *Canna* named President Hardy; and Mr. G. Fry, Lewisham, showed a seedling *Carnation* with two distinct developments on one head.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. J. O'Brien, S. Conrauld, T. B. Haywood, J. Douglas, H. Ballantine, E. Hill, and H. M. Pollett.

This meeting brought forth a fine display of Orchids, several good groups being staged, the brightest of which was that sent by Sir Trevor Lawrence, Bart., M.P., the President of the Society, and tastefully arranged by Mr. W. White, his Orchid cultivator. The group was in two divisions, the larger one being made up of the beautiful Burford

Lodge hybrid *Calanthes*, and the smaller of fine plants of many distinct forms of *Cypripedium Læanum*, the largest and most distinct of which was the fine *C. Læanum giganteum* described by Mr. Rolfe. The *Calanthes* were a very bright group, consisting of abut a score of plants of the richly-coloured *C. Veitchii splendens* ×, and as many of the delicate blush-white *C. rosea* ×, some well-bloomed plants of *C. Burtfordensis* ×, one of the brightest of the dark-crimson hybrids; a good lot of *C. bella* ×, a dark form with white base to the lip, and dark-crimson eye; the richly-coloured *C. porphyrea* ×, *C. versicolor* ×, a new hybrid of the *C. vestita* section, with flowers as large as *C. v. gigantea*, and white with the exception of the centre, which has blended tints of yellow and crimson—a curious commingling of the two chief colours in *C. vestita*. There were also some interesting new hybrids springing from *C. labrosa*, one of the parents.

Messrs. F. Sander & Co., St. Albans, staged a handsome group of Orchids, consisting chiefly of rare species and varieties, and among them a new species of *Cymbidium* from Northern India, and named *C. pulcherrimum*, was a prominent subject; its graceful, arching, narrow foliage was of the texture of that of *C. eburneum*, but the stout scape which was curved downward, bore about a dozen wax-like white flowers, each of the segments of which had a dark crimson stripe, the petals also having a flush of the same port-wine colour in addition to the stripe. The richly-coloured labellum was yellow at the base, with fine lines of a crimson colour on the side-lobes, the middle-lobe being rich yellow in the centre, and dark crimson on each side of the blade; column dark crimson with yellow cap. The plant is good, and said to be unique. Messrs. Sander also exhibited another very rare *Cymbidium*, in *C. cyperifolium*, which has flowers like those of *C. giganteum*, but with pure white lip spotted with dark red. Among the *Cypripediums* staged in this group were the noble *C. Læanum giganteum* ×, *C. L. excellens* ×, *C. L. superbum* ×, *C. Niobe* ×, *C. Pollettianum* ×, *C. radiosum* ×, and nine plants of the variable and beautiful *C. insigne montanum*. Other good plants in this group were two large ones of the fragrant *Trichostema suavis*, two *Cattleya Hoifordii* (uteola), the delicately-tinted *C. O'Brieniana*, *Lælia autumnalis virginialis*, *Oncidium Rogersii*, *O. chlorophorum*, several *Odontoglossum crispum*, *O. ramossissimum*, *O. rosaceum*, *Cattleya dolosa*, *Odontoglossum Roezlii album*, *Lycaste Skinneri alba*, with ten flowers and buds, *Mormodes buccinator aurea*, a fine *Vanda cerulea* &c.

Messrs. Pitcher & Manda, The United States Nurseries, Hextable, Swanley, Kent, had a fine group, consisting mainly of rare *Cypripediums*, and among which the variation among the forms of *C. insigne* was remarkable, *C. i. Amesianum*, *C. i. Eyermannii*, and two or three other named kinds exhibiting very curious and distinct features. Their group also contained several specimens of the rare *C. Sallierii Hy-anum*, one of the large *C. tonsum superbum*, *C. Arthurianum*, and many others, one of the handsomest of which was *C. Læanum Maserelianum*. Messrs. Pitcher & Manda also effectively worked into their group the varieties of *Lælia autumnalis*, *Odontoglossum Humeanum*, and *O. luteum*.

Messrs. Collins & Collins, Cumberland Park Nurseries, Willesden Junction, staged a fine group of *Cypripedium insigne*, chiefly of the old type, and one or two distinct and showy new varieties. The group was set up with Ferns, &c., and had some good *Oncidium tigrinum* and *O. pratense* at the back, and a few good pans of the scarlet *Sophranitis* in front.

C. Ingram, Esq., Elstead House, Godalming (gr., Mr. Bond), sent a plant in flower of the beautiful *Dendrobium Macfarlanei*, whose flowers greatly resemble those of a white *Lælia anceps*; also two hybrid *Cypripediums*, the one between *Chantini* and *Harrisonianum nigrum* ×, and the other between *C. tonsum* and *C. Spicerianum*, also *C. radiosum* ×.

Baron Schroder, The Dell, Egham (gr., Mr. H. Balauntine), exhibited a fine spike of the new bright rosy-crimson *Schomburgkia Sanderiana*.

Messrs. Hugh Low & Co. sent a good plant of *Cypripedium Læanum Claptonense* ×, a flower of good substance, and with a little purple colour in the dorsal sepal.

Mr. Prewett, Swiss Nursery, Hammersmith, staged a plant of *Dendrobium superbens*. Malcolm S. Cook, Esq., Kingston Hill, exhibited a fine specimen of *Lælia alba* with fourteen spikes, also cut flowers of *Lælia elegans*, *Coclogyne barbata*, *Cypripediums*, &c.

Messrs. Lewis & Co., Southgate, had a small group, with a fine large form of *Cypripedium Curtisii*, two plants of *Zygopetalum Mackayii coccineum*, *Epidendrum ciliare*, and four good forms of *Odontoglossum crispum*; and C. W. Lea, Esq., Parkfield, Hallow, Worcester, gr., Mr. A. G. Catt, exhibited a fine spike of *O. coronarium*, to which a Cultural Commendation was given.

E. H. Woodall, Esq., St. Nicholas House, Scarborough, sent a fine spike of *Lælia anceps grandiflora*.

Fruit Committee.

Present: Philip Crowley, Esq. in the chair; Dr. Hogg, Rev. W. Wilks, and Messrs. J. Lee, R. D. Blackmore, Harrison Weir, G. W. Cummins, C. Ross, A. H. Pearson, W. Warren, T. J. Saltmarsh, A. D-an, W. Bates, W. Denning, G. Wythea, J. Hudson, H. Balderson, F. Lane, J. Smith, J. Cheal, and P. C. M. Veitch.

A capital lot of Apples, comprising fifty-two dishes, was exhibited by Mr. H. Alderman, gr. to G. Hatfield, Esq., Morden Hall, Morden; the majority of the fruit in this collection was of a high-class quality, the best varieties, however, being Bienenheim Orange, Peasgood's Nonsuch, Warner's King, Alexander, Alfristow, and Wellington.

Mr. A. Verdon, Greyhound Hotel, Carshalton, sent a dish of Apples of a large size, said to have been gathered from a tree over a hundred years old, which, moreover, seldom fails to bear fruit freely. The name given it was Wittington Füllbasket, and, notwithstanding its age, the tree, in some seasons, it was reported, yields 20 bushels of fruit.

Miss M. MacKnight, Maldon Lodge, Wallington, showed a dish of Croft Angry Apple; and Mr. J. Vass, Finches, Lindfield, sent a few dishes of Apples and Pears of good quality. Mr. C. Turner, Slough, staged a dish of Apples named A. P. Baron, the fruit being of excellent shape, as also were those of the new seedling Apple, Captain Sanders, samples of which were shown by Messrs. G. Paul & Sons, Cheshunt. From Messrs. W. Paul & Sons, Waltham Cross, came a small collection of Pears, and Mr. A. Colbourne, Woolhampton, Berks, sent a dish of German Apples.

Pines were grandly shown by Mr. T. Coomber, gr. to J. A. Rolls, Esq., The Hendre, Monmouth, who sent three magnificent specimens of Charlotte Rothschild and Smooth Conference. One fruit of the first-named weighed 9 lb. 14 oz., and those of the latter 8 lb. 4 oz. and 9 lb. 4 oz. respectively. They were remarkably well grown.

Mr. E. Gilman, gr. to the Earl of Shrewsbury, Ingestre Hall, Stafford, showed fruits of Ingestre Hybrid Melon, a white-flesh variety; and Mr. Walter King, gr. to Philip Crowley, Esq., Waddon House, Croydon, two fruits of the Citron, and a pot of the same preserved. The latter was of a brisk pleasant flavour, similar to marmalade.

A dish of fruit of *Banhamia fragifera* came from R. J. Wakes, Esq., Trevanick, St. Austell, Cornwall. Three dishes of Tomatos, Improved Hackwood Park, were shown by Mr. H. Wateley. A few Onions came from Mr. E. J. Wills, Baubury.

List of Awards.

ORCHID COMMITTEE.

MEDALS.

Silver Floral.

To Sir Trevor Lawrence, M.P., for group of Orchids.
To Messrs. F. Sander & Co., St. Albans, for group of Orchids.

Silver Banksian.

To Messrs. Pitcher & Manda, Hextable, Swanley, for group of Orchids.

Bronze Banksian.

To Messrs. Collins & Collins, Cumberland Park Nurseries, Willesden, for group of Orchids.

Award of Merit.

To Messrs. F. Sander & Co., for *Cypripedium Læanum giganteum* and *Cymbidium pulcherrimum*.
To Baron Schroder, for *Schomburgkia Sanderiana*.
To Sir Trevor Lawrence, for *Calanthe versicolor* and *Læanum giganteum*.
To Messrs. Pitcher & Manda, for *Cypripedium Læanum Maserelianum*.

FLORAL COMMITTEE.

MEDALS.

Bronze Banksian.

To Mr. W. Wells, Earlswood Nurseries, Redhill, for a collection of *Chrysanthemum* blooms.
To Mr. Wateley, Hillingdon, for *Chrysanthemum* blooms.
To Mr. T. S. Ware, Tottenham, for groups of *Helicoboras*, &c.

First-class Certificates.

To Messrs. Pitcher & Manda, for *Zanna integrifolia*.
To Mons. L. Duval, Versailles, for *Vnesia* × *cardinalis*.

Award of Merit.

To Mr. R. Owen, Maidenhead, for *Chrysanthemum* Henry Perkins, Boveyn, J. S. Fogg, Thos. Selwood, Lizzie Cartledge, and F. G. Hill.
To Messrs. Pearson & Sons, Nottingham, for *Chrysanthemum* E. G. Hill.

FRUIT COMMITTEE.

MEDALS.

Small Silver.

To J. A. Rolls, Esq., The Hendre, Monmouth (gr., Mr. T. Coomber), for Pears-apples.
To G. Hatfield, Esq., Morden Hall (gr., H. Alderman), for collection of Apples.

Cultural Commendations.

To Mr. J. Voss, Finches, Lindfield, for Pears Doyenné du Comice and Beurré Duval.
To Mr. H. Wateley, Hillingdon, for Tomato Improved Hackwood Park.
To Philip Crowley, Esq., Croydon (gr., Mr. W. King), for fruits of Citron.

NATIONAL CHRYSANTHEMUM.

DECEMBER 7.—A meeting of the committee took place at Anderton's Hotel, Fleet Street, Mr. R. Ballantine in the chair, and there was a large attendance of members. Among the correspondence read was a letter from the Rev. W. Wilks, secretary of the Royal Horticultural Society, announcing that in reply to a representation from the committee of the National Chrysanthemum Society, the November meeting of the Royal Horticultural Society in 1892 would be held one week later than usual, so as not to clash with the exhibition at the Royal Aquarium. The secretary was instructed to convey the thanks of the committee to the Rev. W. Wilks for his courtesy. A letter from Mr. J. H. Goodacre, of Elyston Castle Gardens, suggesting the adoption of some means by which greater uniformity in exhibiting blooms of incurved *Chrysanthemums* could be secured, was referred to the Schedule revision committee. Some awards recommended by the Floral Committee at their meeting on October 28, and by the judges at the November exhibition, were approved. The Secretary reported the dispatch of the Challenge Trophy to the Havant Chrysanthemum Society, the holders of the same until November next, and its safe arrival. Also that the special prize fund, opened at the annual dinner, amounted to £25, including a sum of £9 from Messrs. Reid & Bornemann, nurserymen, Sydenham. A recommendation from the Floral Committee, in reference to a suggested improvement in exhibiting blooms of Japanese *Chrysanthemums*, was referred to the Schedule revision sub-committee. It was resolved that three exhibitions be held in 1892, viz., the usual early show in September with Dalhas, one in October, and one in November; each exhibition to extend over two days—these to take place, as usual, at the Royal Aquarium, Westminster. The November show to be held on Tuesday and Wednesday, November 8 and 9; the date of the other two exhibitions to be suggested by the Schedule sub-committee. The Chairman and Secretary were requested to wait upon the Director of the Royal Aquarium, to arrange. The following members were appointed a Schedule sub-committee:—Messrs. Addison, B-van, Boyce, Craue, Gibson, Gordon, Stevens, and Wynne, with the officers *ex officio*. Twenty-four new members were elected, including one Fellow; and the Havant and Tenby (South Wales) *Chrysanthemum* Societies were admitted to affiliation. A hearty vote of thanks was passed to Mr. Thomas Bevan, for providing the dessert and arranging the floral decorations at the recent annual dinner. A vote of thanks to the Chairman brought the proceedings to a close.

DECEMBER 9, 10.—The early-winter exhibition of the National Chrysanthemum Society was held at the Royal Aquarium, Westminster, on the above-mentioned dates, and, although small, was attractive. *Chrysanthemums* were not so numerous as might have been expected, but those staged were of fair quality. Neither were *Cyclamens* very plentiful, while of *Primulas* only two or three lots were shown, but in each case the plants were well-flowered.

The principal features were the collections of cut *Chrysanthemums* shown in bunches, the 1st prize for which went to Mr. H. J. Jones, Ryecroft nursery, Lewisham, for a meritorious lot. This exhibit contained some capital blooms, remarkable for their freshness and the manner in which they were staged. The flowers were bunched loosely, and shown with Maidenhair Ferns. The 2nd prize in this class was awarded to Mr. W. Wells, Earlswood nurseries, Redhill, for a good collection of fresh blooms.

For twenty-four blooms, any varieties, Mr. T. Taylor, gr. to Sir John Lubbock, Bart., High Elms,

Farnborough, was 1st, with good flowers, conspicuous amongst which were Lady Lawrence, Mabel Ward, and Grandiflora; and Mr. J. Brown, gr. to Mrs. Waterlow, Great Doods, took 2nd honours.

Mr. C. F. Salter, gr. to Mr. T. B. Haywood, Reigate, was 1st for twelve blooms, which included good examples of Moonlight, Lady Lawrence, Carew Underwood, Mr. G. Deover, and Sunflower; Mr. C. Cox, The Grange, Birchenden, was 2nd; and Mr. H. Shoemith, gr. to M. Hodgson, Esq., Shirley, Croydon, a close 3rd. In both the latter stands the blooms were fine, and very fresh.

Mr. Shoemith took 1st prize for twelve blooms of Princess of Teck or any of its sports, with remarkably fine flowers for the time of year. The varieties shown in this stand were Lady Dorothy, Hero of Stoke Newington, C. Gibson, and the type. Mr. Peter Bair, Trentham, was 2nd, and Mr. W. W. Gilbert, Norfolk, 3rd.

For twelve bunches of Japanese blooms, Mr. Wells, Redhill, was 1st; Mr. J. Bridle, gr. to R. Falconer James, Esq., Hesse, Hull, 2nd; and Mr. J. Browne, Great Doods, Reigate, 3rd. Mr. Newell, gr. to Sir E. Saunders, Fairlawn, Wimbledon Common, was 1st for six bunches of Japanese; and W. A. Searing, The Gardens, Oakshott, Sevenoaks, 2nd.

For twelve bunches of Japanese blooms, Mr. Lang, gr. to Miss Smith, King's Ride, was 1st; Mr. Taylor, 2nd; and Mr. W. W. Gilbert, 3rd.

The best epergne was shown by Mr. C. Ings, gr. to Sir Spencer Wells, Bart., Golder's Hill, Hampstead, that of Mr. Newell being placed 2nd; Mr. W. A. Searing was 3rd.

In the miscellaneous classes, Messrs. Cannell & Sons showed a nice collection of Chrysanthemum blooms and plants of Primulas, for which a Silver Medal was awarded. Similar honours went to Messrs. Pitcher & Manda, Hextable, for a group of Cypripediums; to Messrs. Clibran & Sons, Altrincham, for a collection of Chrysanthemums; and to Mr. R. Owen, Maidenhead, for Chrysanthemums.

Messrs. Cutbush & Sons, Highgate, staged a group of miscellaneous plants, and Mr. J. Bateman, gr. to Mrs. King, Southwood, Sydenham, a collection of Primulas. Cyclamens were best shown by Mr. David White, gr. to Mrs. Farrell Watson, Isleworth; and Mr. May, St. Margarets, staged plants of Cyclamen Queen of the Whitea, for which a First-class Certificate was awarded.

Mr. W. Webster, The Gardens, Streatham, was 1st for three specimen Chrysanthemums.

VEGETABLES.

GOOD WINTER BROCCOLIS.

If mild weather continues there will be no lack of green vegetables, as in some gardens the late Autumn Giant Cauliflowers are not over. But it usually happens that after a mild autumn we get a severe winter, so precaution should be taken to house the early kinds of Broccoli when at their best. Snow's Winter White, a grand Broccoli for early winter use, will need looking over frequently, and those with small heads removed to a safe place. This variety is often difficult to obtain true to name, but if it can be got, it is valuable on account of its beautiful white heads and superior mild flavour. I usually make two sowings of this kind, the first to succeed the Cauliflowers, and the next for December use. Usually it is about the size of a cricket-ball at the latter date, and invaluable for table use.

There are now so many kinds of Broccoli, that it may be of interest to the young beginner to name a few of the best, and to point out the importance of planting this crop on firm land. When planted on newly dug and freshly-manured land, the growth is so soft, that in severe weather the plants invariably succumb. It is also advisable to plant on different quarters of the gardens, as often one lot is saved while others are lost.

A very good variety for spring use is Veitch's Spring White. It is not large, but of excellent quality, and the head is well protected. The well-known Walcheren is also most valuable for the same purpose, and Penzance Early White is deserving of notice. To follow these I grow Cattell's Eclipse, an old variety, and not liked by everyone on account of

its sulphur colour, but it is one of the hardiest kinds grown. Gilbert's Late White is a good variety, and should be in all collections of late kinds. For late use I give Model, a very hardy kind, the first place. It is the only one that survived the severe weather last winter with me, and I advise its being planted largely in all gardens. For winter work, too, it is invaluable on account of its hardy free-growing qualities. It has a very sturdy habit, short leg, with a very hard stem, and the foliage is close to the ground; the flower is beautifully white, and very close. I also advise heeling over at this date; as though it diminishes the size of the heads, it often saves the crop. G. Wythes.

VARIORUM.

SOUTH SHIELDS CHRYSANTHEMUM SOCIETY.
NOVEMBER 25—This town has held previously three successful shows, but recently these have been discontinued. This year the new Assembly Hall, standing on about one acre of ground, afforded a splendid site for a Chrysanthemum exhibition, and by dint of hard work on the part of the committee and the honorary secretaries, Mr. Bernard Cowan and Mr. H. Hinde, good results were obtained. Mr. B. Cowan has been associated with the society for a long time, and his services were of great value in making the affair a success. The blooms and plants reflected great credit on the cultivators, mostly local or, at least, north country residents. Although good work was done, great improvements may confidently be looked for next autumn.

WALNUTS.—It may not be generally known that the English market is largely supplied with Walnuts from Grenoble. The crop is often imperilled by the spring frosts, to which that part of France is subject.

THE MANUFACTURE OF JAM.—*Apropos* of the article which appeared in our issue of November 14, it may interest our readers to know that Mr. W. P. HARTLEY, Aintree, Liverpool, turns out at his jam factory 100 tons of jam per day, which is equal to 112,000 2-lb. jars daily, and the number of persons employed by him in the busy part of the summer months is between 1,100 and 1,500.

FLOWERING OF THE AMERICAN ALOE.—It is not remarkable that in the reports of the Chrysanthemum show held at York the other day, special notice has been taken of the American Aloe exhibited in flower by Lord Deramore. May I put before your readers the following extracts from that classical work on horticulture, *Miller's Gardeners' Dictionary*, 1731, folio ed? "I can't here forbear taking notice of a vulgar error or two relating to the large American Aloe, which is, that it never flowers until it is an hundred years old, which is a mistake, since we have had several of them flower in England, some of which were known not to exceed fifty years old, &c." . . . "Another common error is that when the flower opens it makes a report like that of firing a gun; this is sufficiently confuted by all those who have been where these plants have flowered; but I suppose the rise of the story might proceed from some persons saying when one of these plants flowered it made a great noise, meaning, thereby, that whenever one of them flowered in England it was spread abroad as an uncommon thing, and occasioned a great noise amongst the neighbouring inhabitants, most of whom usual repair to see it as a thing that rarely happens and as a great curiosity." I fear that when "vulgar errors" had not met with their antidote in the newspaper press, they were long in dying. *Richd. Reynolds*, in the "Yorkshire Post."

shire, by Isabella, daughter of Mr. J. Horne, of Stirkoke, Caithness-shire. He emigrated to New South Wales in 1839, and was for fifteen years engaged in sheep farming. He was a member of the Legislative Assembly of New South Wales from 1854 to 1874, during which period he did much to improve the railway communication in the colony. Sir William Macleay devoted much attention to scientific pursuits, especially to entomology, and in 1874 conducted, at his own expense, a successful mission to New Guinea. He was the first President of the Australian Linnean Society, was President of the Entomological Society, and has been member of the Legislative Council since 1874. *Times*.

MR LISTER KERSHAW, nurseryman, florist, and landscape gardener, died at his residence, Brighthouse, on November 21, at the age of 67 years. Twenty-six years ago Mr. Kershaw established the well-known Elm Wood nurseries in Bradford Road, Brighthouse, and some few years later a florist's business in the town. He was well-known as a successful landscape gardener, and was the recipient of many awards for designs for parks and gardens, notably Bowling Park, Bradford, West Hartlepool, and the Devonshire Park, Keighley. Amongst the places that he designed and carried out, mention may be made of Bradford Moor Park, Chipping Norton Park, public parks at Stratford-on-Avon and in Jersey. He was an enterprising and successful man of business, and took a prominent part in local matters.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending December 5, is furnished from the Meteorological Office:—

"The weather during this period was again very unsettled, mild, and humid, with rain at frequent intervals.

"The temperature was above the mean in all districts, the excess ranging from 3° in Ireland,

Obituary.

SIR WILLIAM MACLEAY.—A Dalziel telegram from Sydney, dated yesterday, announces the death of Sir W. Macleay, brother of Sir G. Macleay, Pendell Court. Sir W. Macleay, who was born in 1820, was the son of Mr. K. Macleay, of Newmore, Ross-

to 4° or 5° in most parts of Great Britain, and to 6° in 'England, S.' The highest of the maxima, were generally recorded between the 3rd and 5th, and varied from 56° in 'Ireland, N.,' to 59° in 'England, N.W. and N.E.,' and to 62° in 'Scotland, W.' The lowest of the minima were recorded during the earlier part of the week, and ranged from 25° in 'England, E.' and 'Midland Counties,' to 30° in 'Scotland, N.' and 'Ireland, N.' In the 'Channel Islands,' however, the thermometer did not fall below 44°.

"The rainfall was rather less than the mean in 'England, N.E.,' and equal to it over the 'Midland Counties.' In all other districts it was more than the normal, the excess in most cases being considerable.

"The bright sunshine shows a decrease on that recorded during the preceding week, but in all the western and north-western districts it again exceeded the mean for the time of year. The percentage of the possible duration ranged from 8 in 'England, S.,' and 9 in 'Scotland, N.,' to 26 in 'England, S.W.,' and to 30 in 'Ireland, S.'"

MARKETS.

COVENT GARDEN, December 10.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

LARGE arrivals of Canada and Nova Scotia Apples to hand, prices ruling lower, making the trade for English goods dull. Grape trade firmer at last week's quotations. James Webber, Wholesale Apple Market.

SEEDS.

LONDON, Dec. 9.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report the seed markets well attended this week, as a result of the Cattle

Show. Alsike continues exceedingly scarce, and is much inquired for. White Clover seed keeps dear. American cables come strong. For Trefoil and Rye-grasses there is an improved tone. Peas arrive slowly. Some very choice Canadian Blue boilers now offer at exceedingly tempting rates. Haricot and Runner Beans continue steady. Canary, Millet, and Hemp seed are firm. There is no change in Mustard or Rape-seed. The Board of Trade returns give the seed imports into the United Kingdom for the first eleven months of this year as cwts. 209,583 value £148,528 as against cwts. 358,911 value £709,658 for the corresponding period of 1890.

FRUITS AND VEGETABLES.

SPITALFIELDS: Dec. 8.—Quotations:—English Apples, 3s. to 5s. per bushel; American do., 10s. to 17s. per barrel; English Tomatoes, 4s. to 6s. 6d. per peck; foreign do., 1s. to 1s. 6d. per box; Seakale, 1s. to 1s. 6d. per punnet; Cabbages, 1s. to 2s.; Savoys, 1s. 6d. to 2s. 6d.; Cauliflowers, 8s. to 14s. per tally; Greens, 1s. 3d. to 1s. 9d.; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 1s. to 2s. 6d.; Parsley, 1s. 6d. to 2s. 6d. per dozen bunches; Brussels Sprouts, 1s. 6d. to 2s. per half-sieve; Parsnips, 4d. to 8d. per score; Endive, 1s. to 1s. 6d.; Cabbage Lettuce, 4d. to 9d.; Leeks, 1s. 6d. to 2s. 6d.; Beetroot, 4d. to 1s. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Bordeaux Onions, 4s. 3d. to 4s. 9d.; Spanish do., 5s. 6d. to 6s. 6d. per case; Belgian do., 3s. 9d. to 4s. 6d.; Dutch do., 3s. 6d. to 4s. 6d. per bag of 110 lb.; Celery, 6d. to 1s.; Horseradish, 1s. to 1s. 1d. per bundle.

BOROUGH: Dec. 8.—Quotations:—Cabbages, 2s. to 3s.; Savoys, 2s. 6d. to 3s.; Broccoli, 5s. to 9s. per tally; Spinach, 2s. to 3s. per bushel; Turnips, 1s. to 1s. 6d.; Carrots, 1s. to 1s. 9d. per dozen bunches; English Onions, 4s. 6d. to 5s. per cwt.; English Apples, 2s. to 6s.; Pears, 2s. 6d. to 7s. per bushel; Canadian Apples, 12s. to 25s.; Newtown Pippins, 18s. to 45s. per barrel.

STRATFORD: Dec. 9.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Savoys, 3s. to 5s. per tally; Greens, 1s. 3d. to 1s. 6d. per dozen bunches; Cauliflowers, 9d. to 1s. 3d. per dozen; do., 3s. to 6s. per tally; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 3s. to 4s. 6d.; do., cattle-feeding, 2s. to 3s. 6d.; Parsnips, 60s. to 70s. 6d.; Mangels, 14s. to 18s.; Swedes, 18s. to 25s. 6d.; Onions, English, 100s. to 120s. 6d.; do., Dutch, 3s. to 4s. per bag; Apples, English, 2s. to 6s. per bushel; American, 14s. to 20s. per barrel; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; do., 1s. 9d. to 2s. 6d. per sieve.

POTATOS.

SPITALFIELDS: Dec. 8.—Quotations:—Magnums, 57s. 6d. to 75s.; Regents, 60s. to 70s.; Champsions, 60s. to 65s.; Imperators, 60s. to 65s.; Hebrons, 60s. to 70s.; Bruce Magnums, 60s. to 75s.; Main Crop, 70s. to 90s.; Abundance, 60s. to 80s. per ton.

BOROUGH: Dec. 8.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 85s.; Bruce Magnums, 60s. to 90s. per ton.

STRATFORD: Dec. 9.—Quotations:—Magnums, 60s. to 85s.; White Elephants, 65s. to 75s.; Hebrons, 65s. to 75s.; Scotch Main Crop, 90s. to 100s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Dec. 5, and for the corresponding period last year:—1891, Wheat, 38s. 11d.; Barley, 30s. 9d.; Oats, 22s. 2d. 1890, Wheat, 32s. 5d.; Barley, 28s. 9d.; Oats, 17s. 10d. Difference: Wheat, +6s. 6d.; Barley, +2s.; Oats, +4s. 4d.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; do., inferior, 40s. to 75s.; hay, best, 60s. to 92s.; do., inferior, 26s. to 50s.; and straw, 20s. to 40s. per load.

NOTICES TO CORRESPONDENTS.

BOOKS: J. K. Thompson's *Gardeners' Assistant*, new edition. Blackie & Son, London and Edinburgh.
—MARKET FRUIT GROWING: *G. E. Fruit Growing for Profit*, by Mr. G. Bunyard, The Old Nurseries, Maidstone.

CATTELEYA GRUB: N. C. C. In all probability this is the grub of the *Isosoma*, figured in our columns November 1, 1890. The grub develops into a winged insect.

CLEMATISES, EARLY AND LATE, FOR TRUNKS OF TREES: A. B. Early, one of the lanuginosa type, as Alba Magna or Duke of Norfolk; late, Rubella or Magnifica. If a sweet-scented species is required, plant C. flammula. In your garden you must dig large

holes, afford good drainage, and not plant them deep, rather plant on a slight mound.

COLOURED SPAR: G. E. C. Try Mr. Rosher, Artificial Stone Manufacturer, &c., Church Street, Chelsea.

CORRECTION—CONFERENCE PEAR: In our account of this fruit in our last issue, we inadvertently stated that Miss Rivers drew the figure from which the engraving was executed, which was not the case.

DICKSONIA ANTARCTICA: *Constant Reader*. Lift it, if you can, without disturbing the roots, and put the drainage in good order, but deferring the retubbing until March.

ELMS FOR AN AVENUE: J. M. *Ulmus americana*, *U. campestris*, *U. glabra*, *U. campestris cornubiensis*, *U. montana*, Huntingdon Elm. The above make big trees, and would harmonise if planted in pairs in an avenue. There are many more Elms, but none that would harmonize with these in size, habit, &c.

GARDENING SITUATION IN U.S.A.: *Fred. G.* One of the best mediums for advertisements of the kind you wish to insert is *Garden and Forest*, published by the Garden and Forest Publishing Co., Tribune Buildings, New York. The *American Florist* has a big circulation: 54, La Salle Street, Chicago.

GREATEST WEIGHT PER ACRE OF STRAWBERRIES: G. E. Between 1½ and 2 tons, but the weight varies according to variety, soil, and method of cultivation.

INSECTS: G. P. H. The grubs of some kind of weevil, very destructive to the roots of plants. Catch the full-grown weevils, and hand-pick all potting-soil before using it.

MALFORMED APPLE: W. Brown. These freaks of Nature are not uncommon. In this case there had been a union of two blossoms, and later of the fruits—one well-developed in all its parts, the other not much developed. The former attained its normal size, whilst the latter remained small.

NAMES OF FRUITS: J. H. B. Striped Beefing.—*W. H. H.* 1, Blenheim Orange; 2, Fearn's Pippin.—*T. N.* Not recognised.—*A. G. G.* 1, Yorkshire Beauty; 2, Gravenstein; 3, 4, 5, not recognised; apparently worthless varieties.—*J. H. W.* 1, Grenadier; 2, Blenheim Orange; 3, Golden Noble; 4, Nelson Codlin; 5, Boston Russet; 6, Winter Strawberry.—*W. F. Beurid* Rance.

NAMES OF PLANTS: C. N. *Griselinia littoralis*.—*W. H.* 1, *Nephrolepis exaltata*; 2, *Adiantum cuneatum*; 3, *Cypripedium insigne*.—*H. G.* *Coelogyne fuscacens* (two varieties)—*J. T. L.* *Blechnum occidentale* (barren); 2, *Davallia pyxidata*; 3, *Blechnum occidentale* (fertile); 4, send a fertile frond; 5, *Abutilon marmoratum*.—*P. A.* *Retinospora plumosa aurea*; 2, *Thuia*, we cannot tell which from the scrap sent; 3, *Retinospora leptoclada*; 4, *Thuiopsis dolabrata*.—*MYNOGASTER: Major-General Berkley*. It is *Diachæa leucopoda*. The name that you employ is given to the British Museum collection, *W. G. S.*

SEEDLING BRIAR: H. P. It is a good stock for most kinds of Roses, and is excellent for grafting or crown-budding, so that the scion may in time come beneath the soil; and because the roots when young are small and pliable, it is a good stock for potting. See "Rosery" in this issue.

THE BEST STEWING PEAR: J. B. S. The Verulam is, perhaps, one of the best, of a crimson colour, and of good flavour when stewed. Season, January to March.

TOMATOS: A. B. Ham Green Favourite, the old red, or Hathaway's Excelsior, if you prefer good flavour to mere size.

CHRYSANTHEMUMS, And How to Grow Them. By C. E. SHEA, Esq.

A Practical and Scientific Treatise, that will be of great service, both to the oldest and most successful exhibitor and the youngest grower of the Autumn Queen. Mr. Shea has, by the treatment explained in his treatise, had a long series of triumphs, to which this season he has added, in keen competition with our most noted growers, at the Kent County, Watford, and Crystal Palace, finishing with the difficult feat of 1st in the 48 Japanese, at the Royal Aquarium Show, Nov. 10.

In addition to the above, a paper by Mr. H. Shoemith is included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world.

This valuable work is now ready, post free, seven stamps.

WINTER and SPRING PRUNING,

TRIMMING, and THINNING OUT can be better and
quicker done by the **STANDARD MANUFACTURING COM-**
PANY'S (celebrated) **TOOLS,** including the "STANDARD" and
"GIANT" **TREE PRUNERS,** the "MYTCUTTAH," and
other useful appliances, than by any means. They were
shown in actual use at the recent Horticultural Exhibition,
Crystal Palace, and at the great Agricultural Shows at Bath
and Doncaster; thousands of visitors being astonished at their
wonderful power and scientific efficiency, coupled with great
saving of time and labour, and the risk to life and limb
reduced. After Stormy Weather, these Tools will be found
invaluable for cutting off fractured branches, leaving the ends
severed in a vital condition.

Sold by the principal Ironmongers and Seedsmen, the leading
Stores, and kindred Trades throughout the world, of whom
Illustrated CATALOGUES may be had; or of the **PATENTERS
and MAKERS,** at their works and depot, **ST. ALKMUIND'S

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.*

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION. — *Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—*The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.*

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

FARMS, ESTATES, RESIDENCES.

Any one desirous of Renting a Farm or Residence, or Purchasing an Estate, can have copies of the

BOROUGH OF WARRINGTON.

APPOINTMENT OF HEAD GARDENER.

The Corporation of Warrington require the services of an experienced gardener at the Bank Park and Gardens. Applications, stating age and salary required, and accompanied by not more than two recent testimonials, to be sent to me on or before Monday, the 14th inst.

Dated this 4th day of December, 1891.

J. LYON WHITTLE, Town Clerk.

Town Hall, Warrington.

WANTED, by the Corporation of Stockton-on-Tees, a thoroughly PRACTICAL GARDENER, to superintend the Laying-Out of the New Park, 40 acres in extent. He must have a good knowledge of Trees and Shrubs, and experience in their Planting; and possess an efficient method in the Management of Men. The person appointed would also be required to act as Urinator and principal Care-taker of the Park. Salary £100, with House, Gas, Rates, and Water Free. Applications, with three recent testimonials, to be sent to me by the 21st inst.

MAT. B. DODDS, Town Clerk, Stockton-on-Tees.

WANTED, WORKING PARTNER, with small capital, in a Market Nursery. Good opening for energetic man.—Apply, W. R. Vine Cottage, Ealing Common, Middlesex.

WANTED, a WORKING PARTNER, to join a practical Mushroom Grower, near London. Good income guaranteed. Age about 25. Abstainer preferred.—**CALADIUM, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.**

WANTED, IMMEDIATELY, for a Reformatory Farm School, near Warrington, a married man without family, to act as **WORKING GARDENER**; Wife to act as **Laundress**. Wages, 30s. per week, with House and other allowances. A total ab-tainer, with good references, essential. Address—**GARDENER, Messrs. Lee & Nightingale, Advertising Agents, Liverpool.**

WANTED, a SINGLE-HANDED GARDENER.—Abstainer. Church of England. Most thoroughly understand Vines, Plants, Kitchen Garden, and Grass-land. Wages, 25s. a week, no cottage.—**Mr. WILSON, 27, Caledonia Road, N.**

WANTED, a young MAN, as GROWER in Small Nursery, used to Ferns, Palms, and Forcing Bulbs. Must be willing and industrious. One who understands Jobbing-work preferred. State wages expected, age, &c.—**HUDSON'S FLORAL DEPOT, 199, High Road, Kilburn, N.W.** A permanency to a suitable man.

WANTED, a painstaking and persevering FOREMAN for the Houses. Wages 16s. per week. Bothy, Milk and Vegetables, &c. State particulars.—**Mr. FLEMING, The Gardens, Alice Holt, Farnham, Surrey.**

WANTED, an energetic young man of good practical ability as **INSIDE FOREMAN**.—State age, experience, and wages required. Bothy.—**W. HATROW, Botanical Gardens, Sheffield.**

WANTED, an UNDER FOREMAN, in the Fruit and Rose Department. Must be well up in Budding, Grafting, and Layering, and know Fruit Trees and Roses well.—Apply, stating wages required, to **WILLIAM BARRON AND SON, Elvaston Nurseries, Borrowash, Derby.**

WANTED, a young MAN, Age 18 to 20. Quick at potting, watering, tying, &c.—Apply, **W. A. TONGUE, Nurseries, Shooter's Hill.**

WANTED, a young MAN, to assist in the Houses, principally Orchids. Wages 15s. per week. No bothy.—**E. AYLING, Forty Hill, Enfield, Middlesex.**

WANTED, a young MAN, about 19 or 20, to help with Shop-work and Furnishing. One who has been in a Nursery preferred.—Apply to **Mr. SEARCY, Floral Department, 41, Connaught Street, W.**

General Nursery and Seed. REQUIRED IMMEDIATELY, in a very old-established Business, twenty-five miles from London, a thorough competent **SHOPMAN**, well up in all branches. Must furnish first-class references as to ability, honesty, and sobriety. Age about 30, preferred.—Application, by letter in first instance, to **B. Q., 41, Wellington Street, Strand, W.C.**

WANTED, a SHOPMAN, well up in Seeds, Bulbs, and Plants; also a good Book-keeper. Will have to travel, therefore must have a general knowledge of Nursery Stock. State age, experience, and salary expected.—**Z. Y. X., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.**

WANTED, a young LADY, of good appearance, as **APPRENTICE** to the Cut Flower Trade; to live out.—Apply to **J. W. SILVER AND CO., Marlborough Mansions, Victoria Street, Westminster, S.W.**

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

HOLLOWAY'S PILLS.—Enfeebled Existence.—This medicine embraces every attribute required in a general and domestic remedy. It overturns the foundations of disease laid by defective food and impure air. To obstructions or congestions of the liver, lungs, bowels, or any other organs, these Pills are especially serviceable and eminently successful. They should be kept in readiness in every family, being a medicine of incomparable utility for young persons, especially those of feeble constitutions. They never cause pain or irritate the most sensitive nerves or most tender bowels. Holloway's Pills are the best-known purifiers of the blood, the most active promoters of absorption and secretion, whereby all poisonous and obnoxious particles are removed from both solids and fluids.

Now Ready, Price 12s. 6d.

THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with **SHELVES**, and Hollow or Ordinary Cast-iron **GRATE BARS.**

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the **FIRST and HIGHEST PRIZE—a SILVER MEDAL**—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

The Best Boiler Extant.

— FRONT ELEVATION —

The longitudinal section gives a view of the fire-box, water space, flues, &c.

— LONGITUDINAL SECTION —

The front elevation shows it set in brickwork, which is necessary for this class of boiler.

SECTIONAL PLAN.

TESTIMONIALS.

MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Yours faithfully, (Signed) G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

Friday, January 8, 1892.

PRELIMINARY ANNOUNCEMENT.

LINDEN'S

GRANDEST DISCOVERY:

CATTLEYA REX,

JAMES O'BRIEN.

THE MOST FAMOUS ORCHID EVER INTRODUCED.

J. LINDEN, the discoverer and first introducer of nearly all the finest Cattleyas in cultivation, viz., CATTLEYA AUREA, AMELYSTOGLOSSA, GIGAS, ELBORADO, TRIANÆ, WAROCQUEANA (LABIATA AUTUMNALIS), &c., confidently recommends—

CATTLEYA REX

as the
FINEST OF THE GENUS.

CATTLEYA REX FLOWERS IN DECEMBER and JANUARY.

Some amateurs have stated CATTLEYA REX to be a good form of Cattleya aurea, with white sepals and petals, but it is a QUITE NEW TYPE.

CATTLEYA REX is described by JAMES O'BRIEN in the *Gardeners' Chronicle*, December 13, 1890.

Sepals and petals are creamy-white. The labellum is of the richest crimson, of various shades—from the rose hue to the purple tint—veined in a beautiful manner with golden-yellow, all worked in to form a richly-colouring marbling. "It is a Wonderful Piece of Colouring."

Mr. R. JOHNSON, Stand Hall Gardens, Whitefield, Manchester, writes to Messrs. LINDEN:—

"The CATTLEYA REX has flowered with us, and a grand thing it is. We have had some of the principal importers of Orchids here to see it; they think your plate in *Lindena* (English edition, Part I., 1891) a true representation of the flower, but the lip of our flower is FINER than your Plate."

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Messrs. LINDEN, L'Horticulture Internationale, Brussels, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY January 8, 1892, at half-past 12 o'clock, the whole of the above importation, just to hand in capital condition.

The plants have been collected by Messrs. Linden's intrepid collector, M. C. Ellner, with the greatest difficulties, who has searched with hundreds of natives for two years after this grandest Cattleya, and only succeeded in discovering those offered.

He states that "it is impossible to find any more."

A portrait made from a plant flowered in Monsieur Warocque's collection will be on view on the day of Sale.

On view morning of Sale, and Catalogues had.

Wednesday Next.

AZALEA MOLLIS and CAMELLIAS from Belgium, 200 PALMS in variety, and 40 lots of FERNS for Christmas decoration, Standard and Dwarf ROSES, 200 lots of English-grown LILIES, HARDY PLANTS and BULBS from well-known Growers, Standard and Dwarf ROSES, LILY OF THE VALLEY, 200 lots of HYACINTHS, TULIPS, and other DUTCH FLOWER ROOTS, and 300 fine imported Bulbs of LILIUM SCOVIKIANUM, just arrived from the Caucasian Alps.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, December 23, at half past 11 o'clock.

On view morning of Sale, and Catalogues had.

Wednesday Next.

DOUBLE and SINGLE BEGONIAS.

A splendid strain, embracing the best-named varieties, the whole forming a grand collection, being sold by a successful and ardent Seed Raiser, who is now giving up their cultivation. All are English grown, strong healthy Bulbs.

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE on WEDNESDAY NEXT December 23, at half-past 11 o'clock.

On view morning of Sale, and Catalogues had.

Friday, January 1, 1892. Preliminary Notice.

IMPORTANT SALE OF ESTABLISHED AND IMPORTED ORCHIDS, from a well-known Private Collection.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, January 1, 1892, at half past 12 o'clock, about 60 or 70 lots of fine ESTABLISHED ORCHIDS, from a private collection, including some grand Cypripediums, amongst them Niobe, Grande, Leanan superbum, Ophanthum superbum, Sobralia xantholeuca, 35 bulbs; Sobralia virginalis, and several large plants of *Cologyne cristata*.

81 lots of DENDROBIUMS, CATTLEYAS, ODONTOGLOSSUMS, and CYPRIPEDIUMS, from another private collection. 100 lots of ESTABLISHED ORCHIDS, another Property, including Cypripedium Morganianum, Harrisonianum superbum, *Cologyne cristata* alba, *Laelia elegans* Bluntii, *Odontoglossum elegans*, *Laelia albidula*, and other valuable species; an importation of 500 *Dendrobium* McCarthiae, 500 *Vanilla spatulata*, 500 *Vanilla Phalenopsis*, received direct for unreserved Sale.

On view morning of Sale, and Catalogues had.

Monday Next.

100,000 FRESH SEEDS OF KENTIA BELMORIANA and FOSTERIANA.

25,000 COCOS WEDDELIANA, and 25,000 ARECA LITESCENS Seeds just received.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY NEXT, December 21.

On view morning of Sale, and Catalogues had.

Monday Next.

Five cases of ARAUCARIA EXCELSA, as received; LILIUM AURATUM, from Japan; fine Bulbs of LILIUM LANCI-FOLIUM RUBRUM, from Holland; South African TUBEROSES and AMARYLLIS, 50,000 SPIREA JA-PONICA; 100,000 LILY OF THE VALLEY CROWNS and CLUMPS; LILIUM HARRIS and CANDIDUM; AZALEA MOLLIS, BORDER PLANTS. Fine Collections of Home-grown LILY-CUPS, DAFFODILS and NARCISSUS GLOXINIAS, and a large quantity of DUTCH BULBS, &c.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on MONDAY NEXT, December 21, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Wednesday Next.

MESSENGER & CO'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country: an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

WINTER and SPRING PRUNING.

TRIMMING, and THINNING OUT can be better and quicker done by the STANDARD MANUFACTURING COMPANY'S Celebrated TOOLS, including the "STANDARD" and "GIANT" TREE PRUNERS, the "MYTCUTTAH," and other useful appliances, than by any means. They were shown in actual use at the recent Horticultural Exhibition, Crystal Palace, and at the great Agricultural Shows at Bath and Doncaster; thousands of visitors being astonished at their wonderful power and scientific efficiency, coupled with great saving of time and labour, and the risk to life and limb reduced. After Stormy Weather, these Tools will be found invaluable for cutting off fractured branches, leaving the end-wood in a vital condition.

Sold by the principal Ironmongers and Seed-men, the leading Stores, and kindred Trades throughout the world, of whom Illustrated CATALOGUES may be had; or of the PATENTEES and MAKERS, at their works and depot, ST. ALKMUND'S CHURCHYARD, DERBY.

CATTLEYA REX.

THE MOST FAMOUS ORCHID EVER INTRODUCED.

On the request of several of our English friends, and of our Continental Customers, we have decided to reserve FIFTY PLANTS of our grand introduction, to be offered directly:—

Good Imported Plants, 126s., 210s., and 420s., according to size, Carriage Free.

The WHOLE of the rest of the importation, about 150 plants, IN CAPITAL CONDITION, will be offered for Sale, by

Messrs. PROTHEROE and MORRIS,

At their Central Rooms, 67, Cheapside, London, E.C., on JANUARY 8, NEXT.

We are the ONLY introducers of CATTLEYA REX. Every plant that may be offered by any other firm came from our introduction.

M. ELLNER, our intrepid collector, who has been searching for it for two years, writes that "it is now impossible to find any more."

A marvellous Chromo-lithographed Plate of CATTLEYA REX (18½ inches wide, 23 inches long), which framed would splendidly adorn the drawing-room of the Orchid-lover, will be sent free of charge, to every one applying for it, on receipt of 3s. 6d. in English Postage Stamps.

To be issued on January 2, 1892.

About 500 IMPORTED PLANTS of CATTLEYA WAROCQUEANA (our LABIATA AUTUMNALIS), of the same varieties as exhibited at PROTHEROE AND MORRIS'S Central Rooms, on October 30 last, just to hand, in marvellous condition, will be included in the same Sale, on January 8, 1892. They have been collected by Mr. P. SILVER, our collector, in "BUNGEROTH'S HUNTING-GROUND," where no collector of another firm has been up to the present.

TO COUNTRY BUYERS.

5000 PTERIS TREMULA, 6s. and 8s. per doz., in 48's.
5000 PHLEBODIUM ANDREANUM, 8s. & 10s. per doz., in 48's.
NIDULARIA, 6s. and 9s. per doz., in 48's.
HEATHS, GENISTAS, PRIMULAS, CALLAS, &c., on rail in London.
25,000 LAXTON'S NOBLE STRAWBERRY, 10s. per 1000.
50,000 NORWICH WONDER RASPBERRY CANES, 15s. per 1000, on rail.
R. J. GRIFFIN Florist and Fruit Farmer, Farnborough, Kent.

PLANTING SEASON.

BARR & SON, 12, King St., Covent Garden, London.

are even excluded by some from their list of hybrid Teas.

Bunnert Fridolin (T.) is a grand new climbing Rose of distinct colour, being a very pretty and deep carmine-rose, deeper in the centre, and with a lighter base to each petal. This is thoroughly distinct from everything else among Roses.

Henriette de Beauveau (T.), a pure yellow, of splendid habit; sweet-scented, and a continuous and free bloomer.

Kaiserin Friedrich (T.) is a clear saffron-yellow, one of the prettiest "Dijon Teas" ever introduced. There is a grand future before the three Roses named above. This variety resulted from Gloire de Dijon \times l'arle des Jardins, and is thoroughly worthy of its fine parentage.

Caroline d'Arden (H.P.) is by no means an exhibition Rose, but for garden decoration, or for making a grand show where massive banks of cut flowers are required, it is a very useful and lasting Rose. The colour is a bright rosy-pink, which grows much softer as it ages; very sweetly scented, and a showy pot Rose.

Cleopatra (T.), pink, with the edges of the petals tipped and splashed with light rose; a thoroughly distinct and unique flower. This kind has probably the longest buds of any Rose; and, although rather few-petalled, it opens into a Rose of grand form and size.

Souvenir de S. A. Prince, syn. The Queen (T.)—I have grown these side by side ever since they were introduced, and fail to discover the slightest difference. Both resulted from Souvenir d'un Ami, and were singularly sent out in the same year, one being an English, and the other an American novelty. Having every good quality of Souvenir d'un Ami, and being of the purest white colour, this is a Rose that is rapidly becoming very popular.

Climbing Niphetos has had the benefit of a recent discussion in this journal, but I am constrained to give it further notice, as it is such a grand white Rose; in fact, I may call it the grandest of all.

Souvenir de Rosieriste Gounod (H.P.)—A good shaped Rose, very full, free, and of a bright cherry-red shade.

Sir Rowland Hill (H.P.), is a grand Rose during a dull season; sunshine is apt to burn it in much the same manner as we find Pierre Notting and others served during bright weather. This Rose is very correctly described as being an exceedingly dark maroon-coloured Charles Lefebvre.

Duchesse d'Auerstadt (T.), has proved a grand Rose with me this season, and will soon be known as one of our best climbing Teas. Colour, pale yellow in the bud, changing to a pretty nankeen-yellow as it expands; very distinct.

Ernest Metz (T.), all growers of Tea-scented Roses should possess this grand variety. It is of wonderfully robust habit, and carries its flowers on a strong and upright stem well above the foliage. It is also quite new in colour, being a very pleasing rosy-carmine, deeper in the centre of the petals, and brighter still on the reverse side. One of the finest exhibition Tea Roses sent out for a very long time.

L'Écôle (N) is one of the finest Noisette Roses imaginable, quite a rival to the grand William Allen Richardson. Yellow, splashed and tinted with beautiful metallic shades of copper and gold. This is a very free-flowering variety, and one of the best Roses for cutting from.

Madame Hoste (T.) has much of the splendid habit found in Anna Ollivier, and is also very much like a pure yellow specimen of that superb Rose. This is one of the most useful Tea-scented Roses grown, and sure to please all who give it a trial.

Gustave Piganeau (H.P.) is one of the very largest Roses grown, and good in every respect. During the past Rose season this variety gained the silver medal as being the best hybrid Perpetual Rose exhibited by nurserymen at the Crystal Palace exhibition of the National Rose Society. When a new Rose beats such as A. K. Williams, La France, Marie Baumann, Mrs. John Laing, and other tried and standard varieties, there can be little need for any further

praise; and yet I must say it is indeed a grand Rose, and one of the very best of its year (1890). Its colour is a brilliant carmine-lake, while it has every quality of size, substance, and form, and is also a grand habited Rose.

La France of '89 (H.P.) is a perplexingly named Rose, and is certain to get confused with the old La France as regards names, although it is altogether distinct from that variety. There is a strong suspicion of the China Rose about this variety, and I should class it among the H. Chinas if I had the task of allotting it its position among the various sections of Roses. It has long buds, which open into large and brilliant red-coloured flowers. It will make a grand garden Rose; I do not expect it to ever take rank among the grand exhibition kinds.

Earl of Dufferin (H.P.) is one of the best all-round Roses ever sent out. It is an excellent grower, carries a large and full flower of most exquisite shape; in fact, perfect in that respect. Colour a very rich and velvety-crimson, with deeper shadings, while the reverse of the petals is a pretty and clear maroon. The petals reflex upon themselves in a most pleasing manner, and so show up the grand and intense scarlet shades against the deep maroon of the reverse side of its petals—quite first-class.

Mrs. John Laing (H.P.) is hardly at home among new Roses now, but as it was only introduced in 1887, and is the best Rose of recent years, I must include it in the eighteen I name as being worthy of anyone possessing. There is no purpose to which Roses can be put that this grand variety will not adorn. It is one of the Gold Medal Roses, and when one reflects that this honour is only won by the best Rose in the show, there can be little need to say more respecting its merits. One point I may add, however, and that is, there are more plants of this kind sold since its introduction than of any other two new Roses of equal age. This fact speaks for itself.

I am not claiming that the eighteen Roses named are the best, but they are the best of those which I have given a thorough trial to in Sussex, and are certain to do in any soil and locality where the Rose will flourish. A. P.

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM GODSEFFIANUM, *hyb. nat.*

THE number of undoubted natural hybrids in the genus *Odontoglossum* is somewhat considerable, though several of them are still very imperfectly known, and others have received distinctive names to which they are not properly entitled. The present hybrid is a very handsome one, and appeared with Messrs. F. Sander & Co., of St. Albans, last May. It was at once pronounced to be a natural hybrid between *O. triumphans* and *O. Lindleyanum*. It might be described as *O. triumphans* with acuminate segments and the lip of *O. \times Coradinei*, its resemblance to the latter being due to the fact that both are derived from *O. Lindleyanum* on the one side. In *O. \times Coradinei*, however, the other parent is *O. crispum*, while in the present hybrid *O. triumphans* stands in this relation. In almost every respect it is remarkably intermediate in character, and its relation to each parent is seen at a glance. Both parents have a very long column, in which our hybrid also agrees; the wings, however, like the lip, are nearer to *O. Lindleyanum* than to *O. triumphans*, though respecting the sepals and petals just the reverse may be said. A form with narrower segments, but with evidently the same parentage, appeared with Messrs. James Veitch & Sons, of Chelsea, in May, 1888. R. A. Rolfe.

DENDROBIUM PHALÆNOPSIS, LEE'S VARIETY.

OUT of some plants of Messrs. Sanders' importation of *D. Phalænopsis Schröderianum*, there has flowered a richly-coloured form, which is much darker than the original. The front view of the flower is of a glowing purplish-crimson, without a trace

of white being visible, except in a slight marbling on the lower halves of the sepals. The reverse side of the sepals and the middle part of the reverse of the petals and under-side of the labellum are white, which renders the dark colour more striking; and in the same way, the bronzy-purple colour of the base and side lobes of the labellum serves to show up to advantage the bright purplish-crimson front lobe. Up to the present, I know of no *Dendrobie* to equal this one for bright-tinted and well-formed flowers. It flowered with W. R. Lee, Esq., Beech Lawn, Audenshaw, Manchester. J. O'B.

THE GLADIOLUS.

ON August 25, at the Drill Hall, I heard a very interesting discussion on the ailments of this fine plant. Great difference of opinion was expressed regarding the supposed disease to which the *Gladiolus* was said to be subject. Some said it was caused by insects, some by fungus, others by too much dampness. A good deal of difference of opinion was also expressed regarding its treatment. Some stated that the *Gladiolus* was benefited by manure at the bottom of the trench, others said too rich a soil kills it; one gentleman stated that his were planted on soil that had not seen any richness for years, and most of his died after growing to a certain stage. The lecturer stated that dampness could hardly be a cause of failure, as on one occasion he lost a number in a very dry season. There appeared to be a suspicion that some disease had got into the *Gladiolus* corms; these corms are nothing but the expanded base of the stem.

Now, along one side of the hall there were about a hundred magnificent spikes of *Gladioli*. Well, to look at these spikes and connect them with diseased corms in any way was out of the question. Then it is still more out of the question to visit Mr. Kelway's nurseries, during the *Gladiolus* season, and see positively thousands of plants. If the *Gladiolus* growers of England can do all this, it seems absurd to fancy that others cannot grow a hundred plants without losing a number of them. There must be some good reason for all these disappointments when the plant is grown on a small scale.

From what I have seen, I find it impossible to believe that there is any disease in the English race of *Gladioli*, any more than I can believe that the disease called small-pox is in the marrow of the British race of people, and for this reason. On one occasion, in a field at Langport, which may have contained a million or more of young *Gladioli*, divided into plots, each ticketed with the name of the variety, this is what I observed: most of the plots in that field were as green as grass; but a few plots, of a different variety, only a few inches from the green ones, were yellowish and sickly. It could scarcely have been the soil or drainage that were at fault; it could scarcely have been a disease spread throughout the race of corms, for they were all descendants from the stock with which Mr. Kelway commenced the raising of this strain. Then what was it that made the difference between a lot that was as green as grass and an adjoining lot that was sickly? It was evident to me that it was the surroundings of that particular variety, which were unable to meet the needs of that constitution. It could not stand the conditions upon which the adjoining varieties thrived.

The Secretary of the Royal Horticultural Society mentioned that his experiment was made with *G. Brechleyensis*, and all died but two, before they flowered. Now, this variety is probably not raised at all in England; certainly, Mr. Kelway does not raise it, and all the *Brechleyensis* corms which are sold in England at 2*d.* and 3*d.* a corm, probably come from France, yet it can be seen at cottagedoors and elsewhere dazzling you with its spikes, and all florists' shops in London have little else but *Brechleyensis* in their windows. Mind you, all the *Brechleyensis* family are descendants, by bulbils, of the one great-ancestral progenitor! Does not all this distinctly say, that it is the surroundings and not

the corms, which are at fault, when the old *Brenchleyensis* fails? Moreover, is it likely that when so many hundreds of varieties are being raised from seed every year, that all would be of an identical constitution? The experience of every horticulturist will distinctly reply, that nothing of the kind happens; and is not the whole of the Darwinian theory based on this very difference of constitution? Is it likely then, that a plant indigenous to South Africa, could stand the British climate in all years, and under all conditions? Is it possible that *Brenchleyensis*, which is so common as to be

surroundings and not the corm that were at fault. Naturally, when the plant begins to decay, all sorts of fungoid growths, and may be insects also, will dispatch it. All vegetable and animal tissues, when decaying, will be so attacked.

I have some suspicion that too much wet will hurt some varieties, especially if the locality be badly drained; and what piece of ground is there that will have every square foot equally well drained? On the other hand, Mr. Kelway will tell you, that in some years he lost acres of *Gladioli* from drought, which proves that too much dryness will injure them.

another. Moreover, damp and drought, and insects and fungi are not the only possible causes of ailment in plants. We never suspect that electrical changes can have anything to do with health, yet every day the opinion is becoming strengthened that electricity has to do with everything, and more especially wherever what we call life is concerned.

Whatever the cause of failures in the hands of certain individuals may have been, the great fact remains, that Mr. Kelway every year succeeds in growing immense numbers of *Gladioli* without losing anything but a very small percentage. After the first growth, the plant depends on the roots, and not on the corm, for sustenance, and if these perish from whatever cause, the plant must suffer. The new corm, being a part of the plant, is subject to attacks of fungi when decay sets in. Further light is needed on the subject. *E. B.*

FIG. 105.—HABENARIA CARNEA: FLOWERS, WHITE AND PINK.

sold at such a low figure, could be so rotted with disease as to fare, from inherent causes, in the way the secretary described? Is it possible that if there were widespread disease in the corms, that Mr. Kelway could grow such fine *Gladioli* by the tens of thousands? Why, the whole thing is unbelievable.

Mr. Kelway, if I remember rightly, told me that on one occasion, as an experiment, he took up some corms, the plants of which were turning yellow, and dried them. Next year these same supposed diseased corms produced healthy plants! If there be no mistake about this point, it would prove that the corms were sound, and that the roots, from some cause yet unexplained, had perished. It was the

In its own country this corm is never lifted, and yet it grows up again every year; and there are many people who will say that they never lifted their *Gladioli* (possibly *Brenchleyensis*), and they came up regularly every year at the proper season.

In order that the *Gladiolus* may thrive in such a changeable climate as this, in every soil, and in every situation, and under all circumstances, it requires to have an iron constitution, and in an exceptionally wet season, such as this, it is not surprising that so many, even of the hardier sorts, failed. In some places the *Gladioli* may have been killed by one cause, and by a different cause in other places. One variety may perish in one place, and thrive in

HABENARIA CARNEA.

This is a new and attractive species, which has been in flower at Kew recently. Although bearing the name of *carnea*, the only portion of the flower which seemed to justify this was the hooded or helmet-like upper segment, which was of a soft pink colour, the other portions being almost pure white. Each bloom is furnished with a pale brown spur, about 2½ to 3 inches long, at the base of the large three-lobed lip. The leaves are small, dark green, paler in the centre and at the edges, and heavily covered with small white spaces, which give them a charming effect. The plant is a native of Singapore. *J. W.*

FOSSIL RESINS FOR VARNISH-MAKING.

THE connection of varnish-making with gardening pursuits is at first sight not apparent, except that varnish as a manufactured article is perhaps as much used by gardeners as by other people. The basis of all varnishes, however, is resin of some kind or other, and as resins are vegetable products, there is another reason why the subject of varnish-making may be referred to in the pages of the *Gardeners' Chronicle*. The manufacture of varnish is a science but little known or understood by those not concerned in the mysteries of the industry, and therefore the appearance of a work devoted to the subject may be fitly alluded to here. Under the title of *A Few Notes on Varnishes and Fossil Resins*,* Mr. R. Ingham Clark has succeeded in producing not only an accurate record of the resins used in varnish-making, but also a readable book, treating on the early origin of varnish, its preparation, and use on ancient pictures; its demand, growth, and commercial extension, &c. On these subjects, the author remarks as follows:—“It is difficult to trace the period when varnish first became known to commerce, although it is of necessity allied to the art of painting. The manufacture, as now understood in Europe, is of comparatively modern date; but a crude knowledge of the article must have been existent at a very early period, for so-called varnishes have been taken from the wrappings of Egyptian mummies, though these were more probably prepared resins or natural balsams. . . . Pliny states that Apelles invented a varnish, the composition of which was known only to himself, and it is also certain that the varnishes which had been made for many centuries by the inhabitants of the eastern parts of Asia were in part known to and employed by the Romans. . . . The works of Apelles, and of those who preceded him, disappeared with the period which saw them produced, and there is no monument in existence to enable us to solve the question as to whether the preservation of the colouring matter employed by these early painters was attributable to varnish or any substance of a similar nature. . . . It may readily be believed that the discovery of varnish was the fruit of repeated

* *A few Notes on Varnishes and Fossil Resins.* By R. Ingham Clark, F.L.S., F.R.G.S., &c. Illustrated by James West. (Charles Letts & Co., 3, Royal Exchange, London.)

trials; and though those who made it had continually in their hands the essential materials, yet there was still a motive wanting—that of sustained demand, which was, however, soon created among peaceable and industrious nations by a taste for luxury, and extended by commercial intercourse."

Mr. Clark of course refers to the art of varnishing or lacquering in Japan, and points to it as being of very ancient origin, though it is considered doubtful whether the art existed previous to the time of the Emperor Jimmu, n.c. 581 to 560. Plantations of *Rhus vernicifera*, however, were established during the reign of the Emperor Mommu, A.D. 701 to 704, when an edict was issued that each farmer employing six hands should plant eighty lacquer trees on his grounds; one employing four hands, seventy, and so on; and also that the annual taxes should be paid in lacquer. This law led to the founding of plantations in every village. The information regarding Japanese lacquer and the references to detailed works on the subject, will be valuable now that fresh interest on the subject has been awakened by Professor Rein's experiments in the trees planted at Frankfort. Mr. Clark next treats rather fully of the much-vexed question of the composition of the varnish used by the old violin makers, and concludes the first part of his book with the statement that of fossil and semi-fossil resins used in varnish-making "the total annual imports into England, a part of which is re-exported, amount to about 4,000 tons, two thirds being represented by the Kauri gum of New Zealand; about 400 tons come from our west African colony of Sierra Leone; 400 or 500 tons from the Philippine and adjacent Islands; and the remainder from various parts of the world, principally that portion of Africa bordering on the torrid zone.

In the second part of the book we find much information on these fossil resins, or gums as they are always known in commerce. A good deal of attention has been paid to this part of the work, and much information carefully brought together, therefore the very few mistakes that occur are the more to be regretted. Thus on p. 36, under the figure of *Hymenæa Courbarii*, the pod is described as enlarged about one-fifth natural size when it should have been reduced. Again on p. 67, *Pistachia* is printed for *Pistacia*, and *Perebinthææ* for *Terebinthacææ*. These are simply misprints, but in a book so well got up, and so extremely well printed, it is a pity for it to be marred even by these slight faults.

NOTES FROM HATFIELD.

HATFIELD is celebrated for its connection with past history and its antiquity, but it is not my intention to notice that part of the subject now. A special supplement of the *Gardeners' Chronicle* appeared on May 9, 1874, which dealt with this matter at some length; still I found many things worthy of notice during a recent visit. The chief feature at the time of my visit (September 23) was the crop of hardy fruit. Abundance of Apples and Pears was to be seen in most gardens this year, but at Hatfield the crops were unprecedented.

The trees in the garden are mostly in the form of huge pyramids or bushes, many of them 16 to 20 feet high, and are composed of a varying number of long branches, like natural cordons—from twelve to twenty on most of the trees; and herein lays the secret of success. When Mr. Norman took charge of the gardens, these trees were about 3 or 4 feet in height, and had been regularly cut back to form round-headed bushes, looking anything but healthy and prosperous, and giving but little fruit. They were allowed to grow away until they reached the size they are now. The growths were kept thinned out, so that all parts of the trees get abundance of light and air, and now they are in perfect health, and most prolific. Some of the best croppers among the Apples this year were Dutch Codlin, Mère de Ménage, Lane's Prince, Albert, Bismarck, Nelson's Codlin, Lord Suffield, Red Astrachan, Hoary Morning, Yorkshire Beauty, among the pyramids; and

Caldwell or Rymer, Sturmer Pippin, Adam's Pearmain, Dutch Mignonne, Mannington's Pearmain, Peasgood's Nonsuch, Lady Henniker, Ribston Pippin, very healthy on standard; Round Winter Nonsuch, Belle Dubois, and Cox's Orange Pippin, on espaliers and standards.

Pears also were borne in large quantities. The best croppers as pyramids were Beurré Clairgeau, Clapp's Favourite, Louise Bonne of Jersey, Knight's Monarch, Doyenné du Comice, Emile d'Heyst, and Crassane, the latter being conspicuous for its heavy crops all over the garden. Among espaliers and trees on walls, the best were Marie Louise, Fondante d'Automne, Van Mon's Leon le Clerc, Josephine de Malines, Passe Colmar, and Comte de Lamy; the latter variety was bearing a fine crop, but the fruit had been thinned out, as had also several of the other varieties of Pears, and smaller Apples, such as Dutch Mignonne, Cox's Orange Pippin, &c. Such varieties as these generally crop too heavily in a good season, and the fruits do not swell to a large size, but timely thinning evidently makes a vast difference.

Peaches and Nectarines on the walls had also some good fruit on them, and a large quantity had been gathered. The walls are built of concrete, and wired; thus, the trees get very little benefit from absorbed sun-heat, as they would do on a brick wall. The branches of the trees are kept well thinned out, especially the shoots of the current year; none are allowed to grow unless they are required, and thus all of them get a chance of ripening. Tomatos were well grown outdoors, the variety being a selection from Ham Green Favourite.

Plants for decorative purposes are grown in very large quantities under glass. All looked remarkably clean and healthy, as did also a fine lot of *Cœlogyne cristata* and *Cypripedium insigne*, and a miscellaneous collection of *Dendrobiums*, &c. Plants of *Saccolabium Blumei* growing in baskets hung up near the glass in a large plant-stove were particularly noticeable. One large house full of *Adiantum canescens* with *Eulalia japonica variegata* dotted amongst it formed a very pretty sight. In the long conservatory, *Salvia coccinea* was flowering well, and is well worth attention for early autumn work for its distinct appearance. *Passiflora Constance Elliott*, *Solanum jasminoides*, *Brugmansia sanguinea*, *Cassia corymbosa*, were also full of flower. A large quantity of healthy *Camellias* were well with flower-buds, and Mr. Norman attributes his success to affording all the water they require overhead so as to thoroughly wash the plants. In a stove adjoining, I also noticed a healthy lot of *Eucharis amazonica*, some plants being in pots, others planted as an edging to the path.

Chrysanthemums are grown in great quantities for producing a large supply of flowers for decorative purposes. A fine batch of the new *Marguerite Carnations* from seed, had been lifted and potted for early winter use, for which purpose it seems admirably adapted, the plants being full of flower-buds. Among many other things, *Canna Madame Crozy* deserves especial mention for its large flowers of a showy but refined appearance, also a fine lot of *Nerines* just commencing to flower.

In the fruit-houses some fine bunches of *Madresfield Court*, *Alicante*, *Lady Downe's*, *Raisin de Calabria*, &c., were hanging. *Peachea* had borne very heavy crops, and looked promising for another season. The demand for Strawberries in early spring is enormous, and many thousand plants are forced annually. *Vicomtesse Héricart de Thury*, *Sir C. Napier*, *Sir J. Paxton*, and *Noble* are the kinds principally grown; *Sir C. Napier* produces extra fine fruit here in pots, but is almost a failure in the open quarters.

Vegetables require to be grown in very large quantities, especially Brussels Sprouts, Celery, Cabbages, &c., and some fine braves of them were noticeable, Veitch's Exhibition and Nowthaw Prize are the varieties of Brussels Sprouts most in favour. Large quantities of Lettuce, Endive, Parsley, &c., were also doing well, and I especially noticed a fine

row of *Cardoons*. Flower-gardening is also carried out on an elaborate scale at Hatfield, early-flowering *Chrysanthemums* being used extensively for an autumn effect. *W. H. Divers, Ketton Hall, Stamford.*

ORCHID NOTES AND GLEANINGS.

LÆLIA AUTUMNALIS FROM Highbury.

SPECIMENS exhibiting the wide range of variation in these, come from the collection of the Right Hon. Joseph Chamberlain, M.P., Highbury, Birmingham. The two extremes are represented by a large narrow-petalled form, and a stout highly-coloured variety, broad in all its parts. In the former, the segments are over 2 inches in length, and not more than half an inch in width. The whole of the lip but the extreme half of the front lobe is pure white, except a few brown dots at the base, and a pale primrose tinge on the front of the keels running down its centre. The column, also, is white, with a rose-coloured tip. The other, the darker and broader flower, exhibits but little white, the base of the lip and keels being yellow, profusely and showily streaked with dark red. Were it not for the known and endless variation in this species, these two would well merit varietal names.

CATTLEYA LABIATA, Lindl.

Two varieties of Messrs. F. Sander & Co.'s importation of autumn-flowering *C. labiata* are now in flower at St. Albans, which exhibit a marked improvement on any other forms of autumn-flowering *labiata* in having a greater breadth of petal, and in one instance a rich, violet-tinted crimson colour in the labellum different from anything observed in the old forms of this species. *J. O'B.*

BIRDS OF THE COMMONS AND WOODLANDS.

UNDER the above heading, we may include nearly all the various birds whose songs help to make English country life so enjoyable. These birds are nearly all small; most of them are dull in colour, and harmonise so closely with their surroundings, that it is extremely hard to detect their presence but for their voices. They are rightly called "warblers," for their singing is by far the most noticeable point about them. Birds of this class are almost entirely "summer visitors," arriving here in spring to build their nests and rear their young, leaving us again in autumn for a warmer climate.

THE WARBLERS.

To this family of warblers belong the two most accomplished songsters heard in England—the nightingale and the blackcap. The former has the bigger reputation, still it always seems to me (although it is high treason to say so), that of the two, the blackcap is the greater artist. The nightingale gives forth its utterances with such an agony of fervour, that for the time—especially if you are a lady—you are quite carried away. Still, his singing is hardly of the highest style; it is rather too sensational and operatic. The blackcap, on the other hand, always keeps the most perfect control over his voice; the notes are deliciously rich, and you do not bear any effort. The two birds are very different in appearance—the one is reddish-brown above and white beneath, while the other is of a dark grey hue, with a neat little black crown on the top of his head, and greyish-white on the under parts. The nightingale frequents the thickets, whereas the blackcap is perhaps most at home in fruit-gardens, where the young birds, who, unlike their mother, have chocolate-coloured crowns instead of black, may constantly be seen in the Raspberry bushes.

The garden warbler is another fine singer. This bird arrives in England rather later than others of its class, generally making its appearance in May. And in addition to the three warblers already mentioned, we are visited every spring by two white-

throats—greater and lesser; and by three little green birds, closely resembling each other, called the wood-wren, willow-wren, and chiff-chaff, all of which may fairly be called birds of the woodlands. The two whitethroats have both white throats, but their colouring is very different in other respects, the larger bird having a reddish-brown back, while the corresponding portion of the lesser whitethroat is dark brownish-grey. The former has rather a sweet song, which it gives forth with great energy usually from the top of a thicket, while the song of the latter is rather loud and monotonous. The wood-wren, willow-wren, and chiff-chaff, as we have said, bear a very close resemblance to one another. They are all of them green above and light underneath. The wood-wren is the largest and the least common, being essentially a bird of the wooded districts, and it prefers Beeches to other trees, consequently it is more local than the other two. All three birds build domed nests; but that of the wood-wren may always be distinguished by the fact that it is never lined with feathers. The willow-wren is a very common species, and has a bright little song in a descending scale, which it repeats over and over again; while the chiff-chaff can only utter two notes which it constantly repeats, usually from the top of some high tree. You can distinguish the willow-wren from its relatives by its yellow under-parts; and the chiff-chaff, besides being the smallest of the three species, is the first to arrive in England, and it has moreover as a rule dark legs. The colours of the legs of birds are, however, a most unreliable test for identification, as they vary very much in different individuals of the same species. Only a few days ago, I had in my hand a chiff-chaff which had been stunned by flying against a window-pane; its legs, instead of being dark brown, were of a bluish slate-grey.

THE GOLDEN-CRESTED WREN.

In localities where Fir woods abound, you will sometimes come upon a flock of minute birds uttering a curious little call, which is more of a squeak than a note; these are golden-crested wrens—the smallest British species. This tiny bird only measures 3½ inches from the tip of its beak to the end of its tail, and yet enormous flocks frequently arrive in England in autumn on the east coast. How these fragile weak little creatures perform a journey across the North Sea is truly wonderful. It is certainly a great strain upon them; for they sometimes alight in swarms on fishing-boats in order to rest, and those which gain the shore are greatly exhausted. It is impossible to estimate the loss of life which such a crossing must cause, but this only makes us wonder all the more at the strength of the hereditary instinct which compels them to start on the journey. In colour the golden-crested wren is green, with the crown of the head orange in the male bird, and lemon-yellow in the female. The nest is a most exquisitely-made hammock of moss.

There are two birds of the warbling class which are essentially birds of commons rather than woodlands: one is a resident species, the Dartford warbler, and the other a summer visitor, called the grasshopper warbler. The former owes its name to the fact that it was first discovered, about 120 years ago, near Dartford; it has, however, since been found in most of the southern counties of England. In appearance it somewhat resembles the wren, but it has a long fan-shaped tail, which it frequently opens while fitting about furze bushes, its favourite haunt. This bird suffered terribly in some places during the cold winter of 1880 to 1881, and no doubt the frost at the beginning of the present year caused a great diminution in its numbers. *A. H. Macpherson.*
(To be continued.)

CLUBBING IN WALLFLOWERS.

SOME short time since, some seedling Wallflowers were submitted to the Scientific Committee of the Royal Horticultural Society on account of the curiously swollen condition of their roots (see p. 621).

Surmising that the appearances were due to a slime-fungus, such as that which causes clubbing in Cabbages, the specimens were sent to Mr. Arthur Lister, who has made a special study of the Myxomycetes, and whose report is printed at p. 621. Mr. Lister has also furnished us with a drawing representing the swollen condition of the root, together with the enlarged cells containing the spores. From this drawing it would seem that the fungus (if fungus it be) is closely allied to the Cabbage root-fungus, but differs

FIG. 108.—CLUBBING IN WALLFLOWER. (SEE TEXT.)

somewhat in the size of the spores. The following references illustrate the cut:—

- B. Transverse section of the clubbed root, taken through \times - \times mag. 18 diam.
 - c. Cortex.
 - vc. Vascular cylinder.
 - p. Pith.
 - MR. Medullary rays.
 - v. Reticulated vessels scattered through the inner mass of enlarged parenchyma.
 - PL. Enlarged cells, filled with spores of *Plasmodiophora*.
- C. Transverse section of central part of swollen root, showing two large cells (PL) filled with spores of *Plasmodiophora*; these are here arranged radially, while in the cortex they are arranged tangentially to the main axis of the host plant. Mag. 250 diam.
- PL. Two large cells emptied of *Plasmodiophora* spores.
- D. Three isolated spores of *Plasmodiophora*. Mag. 250, diam.

PYRAMID APPLE AND PEAR-GROWING.

SEEING that no one has replied to the request of "B. B." (p. 316) on the above subject, I venture to pen a few lines, with the hope that the information desired may be forthcoming in this article. What are often termed pyramid trees of both kinds would be more rightly named bushes; indeed, but few of the former are now-a-days to be seen in new plantations as compared with the latter, and for aught I know, bushes are the best for the majority of gardens. Granted, if stiff ornamental fruit trees are wanted for appearance as the chief point in their favour, then grow correctly-grown pyramids. But, I take it, the bulk of owners prefer trees ornamented with fruit, rather than forms of the individual tree only. Pyramids of either Apples or Pears differ only from bushes in the manner in which pruning and training are carried out. In pyramids the leading shoot is allowed to advance but slowly to preserve the shape, side-shoots below it are restricted in the same manner; while in bushes more freedom is allowed, and to the benefit of the fruit crop too. I would not advise that pyramid trees of either fruit be planted in preference to bushes, for the reasons stated, especially in the case of Apples, for more fruit is obtained from trees which are allowed an extended growth than from that which is restricted, but in the case of Pears it differs somewhat; fruit on closely-pruned trees is obtained much more freely than Apples.

There are two other advantages in growing bushes, as compared with correct pyramids, viz., they are cheaper to begin with, and require less labour in training—two points worthy of consideration. Apples will succeed in soil where Pears will hardly exist, certainly not with advantage; and before planting pyramids, or even bushes, some consideration ought to be given to their future progress. It is more a question of soil than aught else in the culture of both Apples and Pears. Some sorts of the former succeed admirably here, while others will barely exist; while in the case of Pears, but few varieties will give crops at all in the open, while with the advantage of a wall, they succeed fairly well. It is then more a matter of selection of varieties for the kind of soil in which they are to be planted; but where the soil is heavy, cold, and retentive, it seems almost useless to plant Pears at all in the open. For instance, in Apples, Warner's King never fails, while Cellini and Wellington do quite the reverse. With Pears, Marie Louise, on the wall, is always good, while in the open the trees will not grow, let alone fruit. I might go on giving instances of varieties, but these will suffice to show the desirability of making enquiries on the spot before planting largely of either.

To obtain success with either of these fruits, the ground must be thoroughly prepared before planting. In the case of soil which is sandy, deep digging is all that is necessary; but in heavy cold soils, clay or gravel, the stations must be trenched fully 2 feet deep, and 4 feet square on the surface. The top spit must be kept by itself, to be returned to the surface of the hole in which the trees are to grow. The subsoil ought to be broken up thoroughly, and left there. Where the soil is stony, draining will not be necessary; but in the case of clay, provision ought to be made for getting rid of superfluous moisture. A cold wet base for the roots is more productive of canker than anything else. Deep planting is one of the worst evils to be avoided, therefore the stations should be prepared early enough, so that the soil will have time to settle down before planting takes place. In heavy soil the trees should stand on the surface, and be mounded up enough to cover the roots at that time, because in a couple of years it will be found that the soil has settled down so much, that the trees then planted on a mound will only be level with the surface-soil. Trees that are about two or three years from the maiden are best to plant, those which are much older do not start away so freely the first year as do younger ones,

especially when they have to travel some distance. No time should be lost in getting them into their permanent position after November 1. Any bruised or broken roots should be neatly pruned to a sound part, as from clean cuts fibrous roots are freely made the first year. In the case of heavy soil, some compost ought to be provided for covering the roots to give them a start, such as old potting soil, wood-ashes, and decayed vegetable refuse; but in sandy soil it is not necessary, although no harm will be done by adding it.

Manure should not be mixed with the soil at planting time, it has a tendency to create a soft, sappy growth, and which, in a cold heavy soil, invites canker wholesale; the roots are encouraged downwards after the manure instead of the reverse. A dry day if possible should be chosen for the planting, but if no choice is to be had, and the soil is wet, do not make it firm about the roots; rather wait for a time until it dries a bit, but in light soil this is not so imperative.

If there is any fear of winds moving the newly-planted trees, they must be staked at once; nothing is more detrimental to newly-planted trees of any sort than to have their roots loosened by wind and wet. A mulching of partly decomposed horse manure should be laid on 3 inches thick, covering the whole 4-foot space; frost will not injure the roots of established trees, but those that are newly planted are under different conditions.

Pruning newly-planted trees is a subject which does not meet with a quite unanimous opinion as to the proper method to adopt. I am in favour of cutting hard back the first year of any long shoots; my idea is, that the base eyes do not break freely if the length of the shoot is more than 6 inches, and if the eyes remain dormant one year, they seldom if ever grow another. In this way bare stems are often seen in fruit trees. In the case of bushes, the growth made the next year may be allowed more extension, which will induce fruitfulness, simply removing the point of shoots 18 inches or so long, at the same time training the shoots outward with a view of keeping the centre of the tree open to admit light and air. Any weakly, cross-growing shoots are better cut out altogether, giving more space to those retained. Pyramids must be pruned more severely every year to maintain a rigid outline. The leader must not be allowed to extend too fast, or gaps will be formed in the tree, which are bad to fill up afterwards. More attention must be paid to the shape of the tree than to fruitfulness, which is more easily obtained by extension than by restriction of the growth. Summer pinching of the shoots is desirable, as it induces a more correct growth, and by the removal of useless shoots, which would be cut out at the winter pruning, allows more air and light to visit the branches and assists in forming fruit spurs. Where branch space is not limited, as in the case of bush-grown trees, root-pruning to induce fruitfulness in vigorous-growing trees may be avoided. Hard-pruning of shoots which are strong only induces still stronger growths the next year if the roots are not interfered with, but by allowing them to extend such vigorous growths are checked, and end in fruitfulness, even though the roots receive no check; although it is advisable to sever strong fibreless roots 2 feet from the stem all round. In the case of pyramidal growth, root-pruning must be practised to induce fruit at all to be borne; indeed, replanting strong-growing trees is the best plan to follow to effect a speedy cure.

Although mulching with manure of newly-planted fruit trees is absolutely necessary to give the best results, it becomes hurtful if not carried out with some consideration and tact. To lay on a 3-inch thickness in November, leave it there until it has thoroughly rotted in, say May, and then replace it with as much more, is not mulching with common sense. What is mulching applied for, and what are its attendant consequences when wrongly carried out? In the first place, manure is laid on the surface, and termed mulching, to prevent the frost injuring inactive roots, and to maintain the soil in a moist state during dry weather,

so that the roots are induced to remain near to the surface, where it is moist, owing to the presence of the manure, instead of their going down deeply after the moisture they need, and will search for it denied them on or near to the surface. This aspect of the case is all right, but when the manure is left on entirely, so that the roots are kept in one cold state all the spring and summer through the absence of sun, then mulching does positive harm. The proper plan to follow, is to remove the manure when the sun gains power, say in May, if only for a couple of weeks, returning it if there is danger of the roots—which ought to be near the surface, especially in newly-planted trees—becoming dry or parched. I am an advocate of suiting the circumstances of the case to the influence of the weather; if it be wet, cold and sunless, remove the mulching, replacing it upon a change in the atmosphere. *E. Molyneux.*

FORESTRY.

COVERT PLANTS.

(Continued from p. 700.)

THE long-leaved *Gaultheria* (*G. acuminata*) is indigenous to South America, and is found to be hardy in most places of Great Britain and Ireland. Its leaves are of a larger size than *G. Shallon*, and it is best adapted for planting in woods under the shade of trees, where it makes excellent covert. It is, however, not confined to such places, as I find it answers very well in mixed shrubberies, more especially in places where the soil is of a soft open texture, rich in organic matter. It produces its pretty white flowers in early summer, and fruit in autumn, which make a fine contrast with its green, glossy foliage. The best time to plant these shrubs in dry ground and rocky places, is autumn or early winter, and it is likewise an advantage to have the plants prepared in a home nursery, so that they can be lifted and planted where they are to remain on the same day. *J. B. Webster.*

ALASKAN FORESTS.

THE whole of the south-eastern portion of Alaska lying westerly of the coast-range of mountains is a dense forest.

One of the peculiarities of Alaska forest scenery that first impresses the observer is the lack of variety which it presents. The whole forest area is composed of less than half-a-dozen species, and these for the most part are evergreen trees. The Hemlock, white Spruce, and *Arbor-vitæ* are the most prevalent—so prevalent that few would perceive there were anything else. The Hemlock Spruce, to the common eye, would appear to be the same as our eastern species, *Abies canadensis*, but the botanist notices a distinction, and names it *Abies Mertensiana*.

English botanists endeavoured to honour their Prince Albert in the same way, and in some of the catalogues of Pacific trees it figures as *Abies Albertiana*. The white Spruce, though resembling the Eastern, is also distinct, and called *Abies Sitkensis*, because the Russian botanist who first named it found the trees in the vicinity of the Russian settlement, Sitka. The *Arbor-vitæ* is there called Cedar, and is again different from the *Arbor-vitæ* of our Eastern States (*T. occidentalis*), by its paler green tint, and by the enormous size to which it grows. On this account, botanists have named it *Thuja gigantea* (Lobbi of English gardens). The Douglas Spruce is found here and there, as is also the twisted Pine, *Pinus contorta*. There are said to be others here and there which I did not see. In a general way, we may say that the three first named make up the forests of Alaska. Among the deciduous trees, the Oregon Birch (*Betula oregona*) and Alder (*Alnus viridis*) make fine trees, and often form dense woods on river bottoms, or along the wake of receding glaciers. Then there are a few strong-growing Willows, and these together make up practically the arborescent growth of Alaska. Now and then on the high ridges

would be a solitary specimen of the Canoe Birch, Red Maple, and Elder-leaved Mountain Ash, indicating that east of the mountain ridge they might be found in quantity; and among the driftwood along streams, trunks of *Populus canadensis*, one of the Cottonwoods, would occasionally be seen, so that somewhere that may be found in some numbers.

Unfortunately, in the matter of timber, the Alaska forests, as far as I saw them, are of little value. The trees grow so thickly together that, so far as the soil is concerned, they starve one another, and good logs would be very rare indeed. One can scarcely imagine from usual forest experience how closely these trees are packed together. I and my wife undertook to walk 4 miles by an Indian trail through one of those woods to a point where we might head off our vessel. So thick was the mass of vegetation on each side of us, the path being wide enough for one of us at a time to travel single file only, that we could not have seen a bear 10 feet away from us, and only for the rifle carried by the good Presbyterian missionary who piloted us, we would not have trusted ourselves amidst the jungle of foliage which made up these Alaskan forests.

One reason for the dense covering of the land with trees is the favourable conditions for seed germination and the apparent scarcity of seed-eating creatures. The warm temperature given off by the sea of Japan, which comes up south-westerly to break against the Alaska shores, meets the snowy-cold of the mountain peaks, condensing the moisture so that the surface of the ground—or, indeed, anything else—is never absolutely dry, and every seed that falls to the earth has a chance to sprout and grow.

TOTEMS.

In the old Indian village were white Spruces, 20 feet high, growing out of the top of totem poles. These poles are themselves 30 or 40 feet high, and seem to have been selected from the largest trees. They are stripped of their bark, and have carved on them series of likenesses of creatures, real and imaginary, representing the genealogical descent of members of the tribe. It was a curious sight to see the white Spruces, like huge Christmas trees, growing from the flat tops of these poles. In some cases the roots from these living trees had split the poles in their descent to the earth, into which the roots had, in some cases, so thoroughly penetrated, that, should the poles finally rot away, the trees would probably on these stumps of roots continue to grow on as trees high up in the atmosphere. Nothing but a climate continually saturated with moisture would permit of a seed sprouting, and the tree continuing to grow out of the top of a pole in this manner.

THE AWFUL SILENCE.

The woods themselves seem to have the quiet of the grave. Ravens, which for religious reasons the natives here as in most countries protect, may once in a while startle you by a croak so near you as for the moment to make you believe it is the whoop of a wild Indian with scalping proclivities; or you possibly may see a young bear standing on its hind legs, grasping for steadiness a small tree with one of its paws, while it uses the other to gather in a whole armful of branches of wild Gooseberries, from which it plucks with its mouth, somewhat delicately, the fruit. Possibly, also, here and there a snake suddenly crossing your path may, in your ignorance of its character, lead to a sudden "Oa, my!" and a little extra perspiration on your travels. Beyond this, there seems little life to interfere with forest seeds or any other thing.

These favourable conditions favour underbrush also. The *Shallon* grows 3 or 4 feet here, and the evergreen *Berberis* or *Mahonia*, which we have brought into our gardens from that region, and grows a couple of feet or so when transplanted, is 3 or 4 feet there. Then there is a form of our Devil's Club, *Aralia spinosa*—which certainly beats the most Satanish specimens of its eastern relative, and which some botanist has, with excellent discrimination, named *Aralia horrida*—with Raspberries, called Salmon Berries, and prickly Gooseberries of many species, and we have a thicket of vegetation forming

the forest of Alaska, absolutely more impenetrable than anything we can experience in eastern woods.

Still there are cases when from some cause the trees are not overcrowded, and then it is wonderful what magnificent specimens, considering the high northern latitudes, the trees will make. I measured trees of the white Spruce, near Kaigan, that were over 20 feet in circumference, while the *Arbor-vitæ* averaged the size that our Hemlocks would generally do in a Hemlock grove.

HOW DUG OUTS ARE MADE.

The favourable nature of the climate for forest growth may be further illustrated by the enormous size which Birches and Alders reach in Alaska. The *Alnus viridis*, which on the high mountains of North Carolina I have found as mere bushes, grow in Alaska as large as our ordinary forest tree. Wandering through the woods in Chilcat Harbour, I came on what might be termed an Indian boat-yard. They were making "dug-outs" of these Alder trunks. It was customary for our steamer on entering a "port" to fire a cannon, so that the Indians might hear at a distance, and come to the wharf to trade. While they had left the "boat-yard" for the wharf I was deprived of the chance to see them at their boat-building work. It was apparent, however, that they hacked out the log until it was no more than half an inch thick in any part, then filled it with water. Near by they heated stones red hot, which were dropped into the water until it became highly heated and softened the wood. Then stretchers, such as the gables our butchers use for expanding hogs and sheep, were used to spread apart the upper portion of the boat, which in that way was brought to a beautiful form, which a naval architect would consider well adapted to good sailing character, and the pretty dug-out canoe was completed. I had never before thought the Alder good for anything but to make fine gunpowder.

In like manner my estimation of the value of the *Thuja gigantea* for timber was increased by my Alaska experience. In Metlakatla, a town on the borders of Alaska, founded by Indians civilised by the missionary Duncan, a large and beautiful church had been built out of this—their so-called "Cedar-wood." The perfume given to the whole building by this wood was fully equal to the incense of Roman Catholic churches. It is said that, in some countries, Sandal wood, so highly esteemed for making perfumed caskets, is nearly exhausted. When Sandal-wood timber becomes something of the past, Alaska can furnish a good substitute in her gigantic *Arbor-vitæ* or "Cedar."

FLOWERS OF THE FOREST.

The wild flowers of the forest, or, as would be said, the forest flora, cannot be numerous or striking when we consider the density of the arborescent growth, as described. If we go to the woods at all we have to look for the wild flowers on the borders, or where an extra severe cold winter current, or a forest fire, may have destroyed the arborescent growths. One would hardly suppose there were forest fires in a wet climate like this, but they are purposely kindled by the Indians for various purposes. To this destruction by fire succeeds the Fire weed, *Epilobium angustifolium*, but instead of 2 or 3 feet it reaches 5 or even 6 feet in height. Other species of *Epilobium* grow tall and rank. A scarlet Columbine, *Aquilegia formosa*, reminds one of our *Wissahickon*, while the blue Aconite, a form of the European *Aconitum Napellus*, is quite gay, and is suggestive of the woodland scenery of the Old World. Buttercups are there, not yellow, but of a coppery tint, named by Hooker as *Ranunculus orthorhynchus*. Where the woods are not too dense to allow anything to grow, a violet, *Viola sarmatosa*, is found. Like ours, they only make real flowers in the early spring, and from thence on till winter bear seed vessels and seed without blooming. Botanists style these cleistogeme. There is also a "Spring Banty," but not as pretty as ours. It is *Claytonia sarmatosa*. The Indians eat it if they do not admire it. Our wood *Geranium, G. maculatum*, is there represented by a more showy

species, *G. erianthum*, but it does not make the same show, as only here and there on a moist rock, in company with our own Blue Bell of Scotland, *Campanula rotundifolia*, can it find a chance to live. The shooting star of our prairies, *Dodecatheon Meadia*, is also in the same company.

The Nutka Rose, *Rosa nutkaensis*, gives something like our scenery to the borders of woods, but a very peculiar form, *Rosa gymnocarpa*, is almost climbing. It will send its slender branches up among shrubbery 10 or more feet, and in the trails through the woods arch over the path, and with its numerous small scarlet haws give a bright character to the otherwise gloomy path. The wood Strawberries are white, belonging to a different species to ours, and are known as *Fragaria chilensis*. It was first discovered on the South Pacific, whence its name. The most surprising wild flower of the borders of Alaskan woods is, perhaps, the Touch-me-not of our *Wissahickon* drive, *Impatiens fulva*. As it is killed by the first white frost, it would be wonderful to see it in the Arctics only for the knowledge that the seeds are frost-proof. It will sprout, flower, and seed all within a short sub-Arctic summer. Many Ericaceous plants are similar to our own, illustrating the point I desire to make, that, allowing for a slight change in species, the Alaskan forest traveller might readily believe he was in a forest in Maine.

Of course, in a humid atmosphere like that of Alaska, mosses abound. There is this difference between a moss picture there and with us, that when the earth is washed away from a moss-covered bank in our country, the moss will die and falls away too. But the moisture of the Alaskan climate permits the moss to live on, and one may see occasionally what appear to be ropes of moss extending like wreaths or garlands from bank to bank, or hanging in festoons down the sloping sides. In the forests the feet often sink deep in beds of moss, just as they often do in the forests of Canada or our Northern States. *Thomas Mehan.*

CHEMISTRY OF THE APPLE.

(Continued from p. 612.)

In continuation of the chemistry of Apple-tree foliage, we next have to consider the individual constituents of their chemical composition, and the significance of each element upon the welfare of the tree as a fruit producer.

Moisture.—With the exception of the Fameuse variety, the percentage of water in all the specimens of Apple leaves taken May 25, lies between 71 and 72. The Fameuse is more succulent, and contains 75½ per cent. water. In the leaves gathered September 20, we find a general diminution in the amount of moisture, the loss being about 12 per cent. It is interesting and perhaps instructive to note that with regard to the proportion of water, the leaves of May 25 fall into the same order with those of September 20 the Duchess of Oldenburg containing least, and the Fameuse most water, showing clearly that while all have followed the general law in loss of moisture, each has retained its own characteristic individuality. Average percentage of water in young leaf, 72.36; average percentage of water in mature leaf, 60.71.

Organic Matter.—This includes all the combustible material of the leaf, and is composed of carbon, oxygen, hydrogen, and nitrogen. In the leaves of May 25, those of the Duchess of Oldenburg and of the Wealthy, the percentage of organic matter are almost the same, and head the list. The Telosky and Northern Spy also contain almost identical amounts, or somewhat less than the two first-mentioned, while the Fameuse contains the smallest quantity of organic matter. This order is preserved in the leaves plucked September 20. It may be observed that there was a general diminution of water, and increase of organic matter, as the season advances, and that any special variety maintains its relative position to other varieties in this respect throughout the growing season. Average percentage of organic matter in young leaf, 25.31;

average percentage of organic matter in mature leaf, 35.83.

Ash.—The percentage of all the inorganic or mineral constituents of the leaf are included in the ash. With the exception of the Wealthy, we find the amounts of mineral matter of the leaves of May 24 closely approximating to one another. The leaves of the Wealthy fall about one-half per cent. below the others in ash constituents. In those of September 20 there is a general increase in the quantity of ash, amounting from 0.5 to 1.5 per cent. over those of May 25. Average percentage of ash in young leaf, 2.33; average percentage of ash in mature leaf, 3.46.

Phosphoric Acid.—With regard to the composition of the ash, it is difficult to discover in many cases what principle, if any, underlies the distribution of the mineral constituents throughout the tissues of the leaf during its growth. Without reading too much, however, into the results of a single analysis, the results show most clearly that the young leaf contains in its ash a much larger percentage of phosphoric acid than the maturer one; in some instances the phosphoric acid in the latter is but one-half, or even less, than that of the younger leaf. This would lead us to suppose that, as the season advanced, there was a retrograde movement of the phosphoric acid of the leaf to other parts of the tree. As the seed is well known to contain a relatively large quantity of this acid, we may certainly be allowed to think that the food elaborated in the leaf finds its way finally, in part, at all events, to the fruit and other portions of the tree. And this undoubtedly expresses a truth (though probably not the whole truth), as the results show that the average number of pounds of phosphoric acid per 1000 lb. of the younger leaf is higher than the corresponding amount for the maturer leaf, and this in spite of the fact that the percentage of ash in the latter is considerably higher than the former. Average percentage of phosphoric acid in the young leaf, 10.47; average percentage of phosphoric acid in the mature leaf, 5.82.

Potash.—It would not be safe, from the results obtained, to advance strongly any theories regarding the disposition of this important element in the leaf. The percentage of potash in the young leaf is somewhat lower than that in the mature leaf. When we, however, consider the increased amount of ash in the latter, we find that, per 1000 lb., the older leaves contain 1.5 lb. more potash than the younger leaves. On comparing the amounts of potash obtained in these analyses with the quantity as found in leaves of other trees, it is at once apparent that the leaves of the Apple tree are exceptionally rich in this ingredient.

Lime.—The average percentage of lime in the ash of the young leaf is 17.4, while that in the mature leaf is 27.9, an increase of 10½ per cent. This increase would also appear to be regular throughout the varieties examined.

Magnesia.—While the percentage of lime increases during the growth of the leaf, the results show that the percentage of magnesia decreases during that period. Thus, in the young leaf we have magnesia 9.77 as the average percentage, and in the mature leaf this amount is reduced to 4.81. This fact is the more remarkable and interesting when we remember that the percentage of phosphoric acid diminished in the same ratio during the same period. It seems quite possible that these two elements of plant-food are intimately related in the economy of the growing tree, and that in the elaboration of the plant-food within the tissues, and the distribution of this food to the different parts of the tree, these two play a very important rôle.

Oxide of Iron and Silica.—Throughout the whole series the amounts of these constituents are found to be very similar, and the average in the young and the mature leaf closely approximate each other. The iron, after it has performed its functions in the chlorophyll of the leaf, appears to remain in the leaf, and the results show that there is no extra deposition of silica in the cells of the leaf as it grows older.

Nitrogen.—The only constituent of great importance that remains to be discussed is nitrogen. The differences in the amounts of nitrogen contained in the organic matter of the leaves of the different varieties examined are so small that one would not be warranted in drawing any conclusion therefrom as to differences in this constituent between the varieties. On taking the averages, however, of nitrogen of the leaves in the two stages of their growth, a considerable difference is at once apparent—a difference that corresponds to 3 per cent. of albuminoids. The figures are:—Nitrogen in young leaf, 2.94, corresponding to 18.61 per cent. albuminoids; nitrogen in mature leaf, 2.48, corresponding to 15.50 per cent. albuminoids.

The amount of nitrogen per 1000 lb. of the mature leaf is 887 lb., as against 742 lb. in the young leaf. This is due to the increased percentage of organic matter in the older leaf. It is evident from these results, that changes which affect the relative percentage of nitrogen in the organic matter take place in the leaf during its development.

Phosphoric acid, potash, and nitrogen are the three constituents which above all others must be put back into the soil if we are to preserve its fertility. Plants of certain orders require more of one or other of these ingredients than plants of other orders. Some soils are specially rich or poor in one or more of the materials, and, consequently, in the rational mode of application of fertilizers much intelligence and patience must be exercised.

That the leaves of the Apple trees draw a large amount of food from the soil annually has been shown. This must be replaced in excess for the vigorous growth of the tree. The leaves of the tree play no unimportant part; respiration and digestion are their two chief functions, which, if they do not perform well, the tree cannot live and bring to perfection its fruit. Therefore, when we feed the leaves we are indirectly feeding the fruit.

The results of these analyses seem to point in the direction of mineral fertilizers, and specially of potash, as being more particularly required for the growth of the leaves, and, therefore, for the vigorous development of the tree, including an abundant crop of fruit.

FLORISTS' FLOWERS.

THE CINERARIA.

We grow our Cinerarias mostly from offsets, in order that the plants should be true in colour, habit, &c., and our plants fill the side stages of a house that is 50 feet long. These plants continue in flower from about Christmas to May. Visitors when beholding the plants have sometimes remarked that they did not care to grow Cinerarias because of their liability to the attacks of greenfly, which might be a good reason if the sphis could not be kept off. I must admit that it is difficult to keep these plants clean when they are badly attacked, and plants produced from cuttings or offsets are even more difficult to keep clean than seedlings; but both may be kept in good health, and the present is the proper time to have them cleaned. We fumigate with tobacco about once in three or four weeks as a precautionary measure. Another parasite, of a still more insidious kind, is mildew, which will generally show itself in November at the edges of the leaves, which it causes to curl up, and spreads on the under-sides of them. It has a downy appearance, that might by some persons be taken for a natural one, for the slender white threads of the mildew are scarcely to be observed without a lens, and yet it is capable, if not speedily destroyed, of permanently injuring the plants. Our plants became infested to some extent with greenfly when in the cold frames, and they could not be fumigated until they were placed in the houses. They had to contend with greenfly, as well as with mildew, and, as a remedy, I mixed tobacco dust with an equal portion of flowers-of-sulphur, and having laid the plants on their sides, puffed this mixture amongst the leaves with a distributor.

This treatment, together with fumigation on two or three occasions, made a clean sweep of both destroyers. Some growers keep the plants during winter in low lean-to pits, but the larger leaves will, in such structures, sometimes damp off, and when this happens, the full beauty of the plant is gone. A span-roofed house is the best place for Cinerarias, and whenever the outside temperature is higher than 40°, there ought to be ample ventilation by means of the top and side ventilators. Even in very cold weather, a small amount of air should be afforded at the top of the house, the hot-water pipes being slightly warmed, to cause a gentle circulation of air, if it be but for two or three hours about noon. Should the specimen plants not yet be in their flowering pots, it ought not to be longer delayed. It is better to repot Cinerarias when the weather is mild, as at that time root action is more active than in cold weather. An 8 or a 9-inch pot is not too large for a strong plant, and the potting soil may consist of fibrous loam four-sixths, leaf-mould one-sixth, decayed manure one-sixth, and coarse sand in quantity to keep the compost open. Cinerarias should be grown on steadily without check, but never "drawn up," as it is termed, for want of free air. It is not a hardy plant, and a few degrees of frost would destroy some of the leaves, or, if this did not happen, the growth of the plants would be seriously checked. During growth, the shoots should be tied out, and some of the older leaves tied down to allow them to push out quite freely. Let the plants be placed near to the glass, as there the circulation of air is best; but vicissitudes of temperature in such a situation must be carefully guarded against. Gardeners and amateurs doubtless find it much easier to raise plants from seeds than to propagate by means of offsets; but if, at any time, a particularly good variety is obtained, I would advise that, as soon as the flowers are past their best, the stems be cut off an inch or two above the soil. The plant so treated will soon make fresh growths from its base, and these, when large enough, can be taken off with their roots, and planted in small pots. *J. Douglas.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

BOX-EDGINGS.—Although the planting of Box, like that of other evergreens, may be performed at almost any time in the year (weather permitting), the interval from October to March is the best time; and bearing this in mind, any gaps in the lines may now be made good. To do this expeditiously and well, remove a little of the gravel and soil to the depth of about 6 inches, make the soil level and very firm, and dibble in, or lay in, rooted pieces of Box, in thickness and height equal to the bulk of the line, and replace the soil and gravel, and tread it firmly together. If much, or the whole, of the Box-edging has become unsightly, it should be taken up, and laid in a convenient spot, the ground dug, trodden, and levelled in accordance with the gradient of the walk, but making each side level with the other, and the centre of the walk. This done, measure the width of the walk at both ends, putting four stiffish sticks firmly in the ground (two at each end) to mark the position of the edgings. Then strain the line from stick to stick on one side, and with a spade cut away the soil perpendicularly on the walk side of the line to the depth of about 4 inches, and in this trench lay the Box after the roots have been shortened and the tops trimmed evenly, and made about 2 inches thick. Press the soil firmly about the roots or slips, as the case may be, and after the soil has been trodden down the entire length of the edging, fill up the gutter-like space with gravel, a coat of which should also be laid on the walk at the same time, raked over, and then rolled.

THE PRUNING, CLEANSING, AND TRAINING OF CLIMBERS.—The present is a good time to prune, clean, and rearrange any climbers that may require attention in that direction. Roses, Cotoneasters, Pyracanthas, Ceanothus, and such like plants, should, when used as a covering for walls and fences, have their shoots in the first instance trained regularly over the space allotted to them. The lateral growths

of the Rose, some Clematis, and other deciduous climbing plants, should be pruned back to one bud every year soon after the fall of the leaf, pruning those trained against walls and fences having south and west aspects first, and those occupying less favourable positions at a later period. Sometimes brown-scale effects a lodgment on climbers, especially Roses, Cotoneasters, and Pyracanthas. Where this is the case, the insects should be removed with a pointed stick, afterwards well washing the shoots and every part of the tree with a solution, consisting of about 6 oz. of soft-soap dissolved in a gallon of warm water, and a wine-glassful of petroleum; a half-worn out paint-brush free from paint, or a stiffish brush made of bast, are good for this purpose, the mixture being well stirred meanwhile. This done, the trees can be re-arranged, tying or nailing—as the case may be—the shoots in their proper places, not too closely together, doing the work in a manner that will commend itself to good taste.

SUITABLE EDGINGS FOR WALKS UNDER TREES.

—It is lost labour to try to get turf to grow well under trees, especially as an edging for walks. Where this is the case, I know of no plants so suitable for covering the otherwise bare ground alongside roads and walks in the pleasancess as St. John's Wort and Ivy, whichever plant is used, and there is no reason why both should not be used separately at different points. They should be planted, and allowed to extend over any bare space that may be within view of the walk, and simply preventing its encroaching on the gravel space. The present is a capital time for doing such work. All that is required is to thrust a spade into the ground, press it forward, and then drop a few rooted pieces of either plant into the opening thus made, withdraw the spade, and tread the soil about each plant.

BAD-WEATHER WORK.—Advantage should be taken of the too-frequent wet days to make a good stock of labels of various sizes, and pegs for marking out designs, &c.; also to prepare Rose and Dahlia sticks, and other flower supports. *H. W. Ward, Longford Castle, Salisbury.*

THE HARDY FRUIT GARDEN.

Owing to the extreme wetness of the weather, planting will be much delayed, and the workmen set on to the pruning and nailing of bush and wall trees, pushing forward this work while the weather keeps mild. All kinds of fruit trees, with the exception of the Peach, Nectarine, and Fig, may be pruned and nailed.

PYRAMIDS, bushes, and cordons should be so kept thinned of young shoots that light may pass freely amongst them. As frequently seen, these forms of trained trees have an excess of branches, and as a consequence, large fruit is an exception. Much of the annual growth should be shortened back to a few buds at the base, and where crowding is likely to occur, some of the larger branches should be cut out. Pyramidal trees should have the leading shoot fastened securely to a stake, that should reach some distance beyond the tip, and in pruning, this leader should be shortened back each year somewhat; and if growth is weak, it may be shortened back to 15 inches, and to a bud on the opposite side to which it was cut before. Much newly-planted trees slightly, and secure them against wind-rocking. For greater safety in naming the trees in newly-planted orchards, prepare a plan of the planting, and have each tree named on the plan, which should then be kept as a reference.

APRICOTS.—These trees may now be pruned and put in order for the season. If scale be present, brush it off, and then dress the trees with a weak solution of petroleum and soap-suds. Reserve plenty of young wood wherever there appears to be space for it all over the trees, as it is on this that some sorts mostly carry fruit; and do not stick in more nails than are necessary to hold the branches in their place. If the trees are few and time permits, all the old shreds should be removed. Where time is precious, remove only the most decayed or those which are nipping the bark too closely. The main branches of young Apricot trees should be shortened back to the well-ripened portions, and forerights spurred back to a few basal buds, but reserving some of those which are near to the wall of good length. Topdress the border with fresh pasture loam, and when planting make use of burnt earth, wood-ashes, old plaster, and loam.

FIGS.—Preparations should be made for winter protection, notwithstanding the present mildness,

and for this purpose use Spruce boughs, Bracken, or straw thatch. [In southern counties no protection is needed. En.] Root-prune any Fig trees that make much wood and afford but few fruits. *H. Markham, Mereworth Castle, Maidstone.*

THE KITCHEN GARDEN.

PEAS.—Protect the plants as soon as they appear above-ground with Spruce Fir boughs of about 16 or 18 inches in length, stuck on each side of the rows. Failing Spruce, cuttings of Box, Laurel, or Yew may be made use of. A sharp watch should be kept for mice, which commit much mischief in a short space of time, and where cats cannot be employed to catch mice, traps must be set. Slugs may be kept at bay by putting fresh sifted coal-ashes and lime in small quantity mixed together at the side of the rows. These remarks apply also to Broad Beans.

POTATOS.—The sets, when shoots from 2 to 3 inches long have grown, may be planted in 10 or 12-inch pots, or in beds of light soil over a mild hot-bed, at from 4 to 7 inches apart, and 5 inches deep, 12 to 15 inches being allowed between the rows in beds, according to the habit of the variety. Cover the sets at first with a layer of soil 3 inches thick; and later, make the drills level with the surface of the bed. Water sparingly during the first stages of growth, but as the plants increase in size, water may be afforded more liberally. Never use cold water. Give air freely whenever the weather is favourable; and at night, and in frosty weather, cover the sashes with mats, Fern, or straw, and maintain a mild and nearly uniform temperature. If in pots, they should be kept up near the glass, so as to attain a sturdy growth.

YOUNG ONIONS.—These are sometimes asked for in winter, and to be prepared, some seed may be sown thickly in boxes or pans of warmed soil. [Old seed may be watered-in with water in which camphor has laid for a few days, its germination being favoured thereby. Ed.] Seed of good germinating power may be sown on the surface, after the boxes, &c., have been watered, and allowed to get a little dry on the surface; cover lightly with dryish mould, press firm and level, and stand in a forcing-house or pit, having a warmth of 55° to 65°. A sowing may be made of Onions at fortnightly intervals during winter and spring. Sprouting Onions may be planted in pots and boxes, and forced for the sake of the tender leaves.

RADISHES.—These roots are always the best when grown alone. The Olive-shaped Scarlet and Wood's Early-frame among the long-rooted varieties, and the red and white turnip-rooted, are the best for forcing. The soil of the hot-bed should be light and rich, and of the thickness of 6 or 8 inches. The bottom-heat may be 75°, and the top-heat 55° at night, and 65° by day. One ounce of seed will sow 20 square feet, and the seeds are best put in with the finger and thumb just under the surface, at about 2 inches apart. If three seeds are sown in a patch now, thin out to one when it is seen which will make the best plant. Treat like Potatoes. Sow again at intervals of three weeks. *C. J. Waite, Glenhurst, Esher.*

PLANTS AND THEIR CULTURE.

THE STOVE.—*Pentas carnea*, any plants of which had attention in regard to repotting and the denudation of the flower-heads during summer and early autumn, will be found very useful in decoration and cutting from at this season. Their pink-coloured flowers are generally much admired although the habit of the plant is rather stiff and ungraceful. The plants should be grown in a light position, and in an intermediate temperature. The earliest *Poinsettias* plants will be showing their gorgeous bracts, and all damp, which is an enemy to them, should be dissipated by artificial heat in addition to careful ventilation, avoiding as much as possible the needless slopping about of water. The plants, intermixed with Palms and Camellias, are well set off by the green foliage of the latter. Later plants, whose bracts are only partially expanded, should be afforded a little weak manure water occasionally, which will help materially to increase the size of these. At the same time, keep the plants in as light a position as possible.

EUPHORBIA JACQUINIÆFLORA will require the same kind of treatment as the *Poinsettias*, one neat stick being employed in each pot to keep the plants contained in it from getting loosened at the surface of the soil. It is best to strike this plant several together in one pot, and repot with division. Allow

the shoots to hang naturally. Avoid the common error of keeping the soil over-moist, this being a fertile cause of the plants damping off between wind and water. Pay close attention to keeping clean all such subjects as Palms, Anthuriums, Aralias, Crotons, Dracænas, Pandanus, &c., freeing them of all insect pests, most of which plants are liable to be infested with scale insects, not readily seen when few in number, but soon making their presence known when numerous by the shabby appearance of the foliage. *Clerodendron Thompsonianum*, various *Allamandas* and *Dipladenias* at rest often get infested with scale; this pest is more easily destroyed now than after the plants commence to grow in early spring. Now that sunshine is at a minimum, the temperature should be kept as low as is consistent with the health of the plants, say 58° to 60° by night and 65° to 68° by day. On frosty nights it is economy to cover the roof with tarpaulin, mats, Frigi Domo, &c., and if not the whole roof, at least some 7 or 8 feet up from the eaves. *R. Milner, Penrice Castle, Swansea.*

FRUITS UNDER GLASS.

FIGS IN POTS.—Some weeks ago, the preparation of the early lot of Figs for forcing was advised, the earliest crop being taken from plants in pots, if these are annually started at this time of the year, they give a good return in fruit. The buds will be about to burst, and the plants will require to be kept steadily moving, replenishing the bottom-heat materials, so that the temperature may range from 70° to 80°; this is readily managed by ramming the old material closer together, and adding some new, for which purpose fresh sweet leaves are best, if got into a warm state first. When stable-dung is used, as it heats quickly and is not lasting, much care is needed. The trees should be damped over twice a day in bright weather, and in dull sunless days it is advisable not to syringe; or, at any rate, to get the shoots dry before dusk, and to damp the floors, walls, and dry parts of the house instead. A night temperature of 50° will be a safe one, although 52° to 54° in mild weather will do no harm, as outside conditions should be taken into consideration, in regard to the degree of warmth kept up. The day warmth may range 10° or 15° higher if the weather be bright; air should be sparingly afforded on cold days, and cold draughts avoided. The timely thinning of the fruits is important, as nutriment is to a certain degree limited, and too many being left sometimes results in the loss of many fruits. The first house should now be in readiness for forcing; trees started in the first half of December usually give good crops if forced slowly, and the trees afforded time to finish a second crop. See that there is no trace of white scale on any of the trees. The borders should have the layer of the top soil removed, replacing it with a rich dressing if the trees are old, or do not make too much wood. In training Figs, lay in the wood thinly. In later houses, or in those without artificial heating, the pruning of the trees may be done forthwith, and the prunings made use of for increase.

ORCHARD-HOUSE.—If the trees here are wanted to fruit early, place them in the house without further delay, partly plunging the pots. In placing the trees, endeavour to keep those kinds requiring more air near the ventilators or the colder parts of the house. A temperature of 40° to 45° at night, with a 10° rise by day will be ample for the present, syringing the trees with tepid water twice a day in mild, and more sparingly in dull weather. The roots must be thoroughly watered at the start, whether the fresh soil on the surface be moist or not. If early fruits of Strawberries are looked for, plants may be started gently on a mild hotbed of leaves, keeping the plants as close as may be to the lights. If the plants are dry, water them; they will not, or should not, want watering again before the flowers show. A temperature of 40° by night and 45° to 50° by day will suffice. *G. Wythes, Syon House.*

THE ORCHID HOUSES.

THE CATTLEYA-HOUSE.—Plants of *Cattleya Skinnerii* which are maturing their growths in the greater warmth of the *Dendrobium*-house, should now be brought back to their proper quarters, otherwise the season of rest will be curtailed, and the result of next year's growth suffering. I have pointed out how necessary it is, where a great number of Orchids are grown satisfactorily, that there should be more than one house. The *Cattleya*-house affords a good resting-place for *Dendrobiums*, *Bensonias*, *Devonianum*, *foracium giganteum*, *Dalhouseianum*, and the hybrids of *Ainsworthii*, which

should not be placed where there is a low temperature, or the foliage of the current year will be injured, and the strength of the plants impaired. A pretty *Cattleya* now in flower, and a free grower, is *C. Walkeriana*; it is a species that will bloom without fail twice in the year, i.e., midsummer and Christmas. The plants do very well when planted in baskets in peat and sphagnum moss, and placed where there is full sunlight; our plants are shaded for only a few hours in the morning, even in the warmest and sunniest part of the year. The flower-spikes usually carry two flowers each, but when they are very strong, I have known them to show three flowers. The growth of the plant being weak, a number of flowering leads may be grown in an 8-inch basket. The varieties of this plant are considerable in number, and the colours are also much varied. The red varieties of *Lælia anceps* now in flower fail to fulfil my hopes, for although growth is good, the flowers themselves are wanting in size. *Cattleya chocoensis* is a species that comes into flower at this season.

The affording of water to the *Cattleyas* is now a most difficult matter to do aright, but when there is doubt as to the need of water, it is better to err on the side of dryness. The growing sphagnum is a poor guide in the matter, and the plants must be daily under observation before the cultivator is sure that water is needed. Shrivelling of the bulbs is also no guide, as it may be brought about by too much as well as too little water. The temperatures given in the last Calendar will still hold good. Atmospheric moisture must be kept at a low point, as it will be understood by our readers that the lower the temperature of the house, the more it will be loaded with moisture. *A. G. Catt, Parkfield, Hallow, Worcester.*

THE APIARY.

PLANTING FOR BEES.—It is a great advantage to have plenty of pollen-bearing plants in close proximity to the apiary in early spring, as it causes colonies to go ahead much faster when there is no lack of natural supplies of nitrogenous food, so much of which is required for feeding the larvae. Also, when the workers do not have far to go for it, they stand less chance of succumbing to the elements than when they have long distances to fly, the mortality among foraging bees from this cause being very large at that early season, and anything to mitigate the evil is a gain to the colony, the life of every bee saved as early as this materially helping the stock to reach the necessary strength to take full advantage of the first honey flow that arrives. Colonies ought to be strong enough to yield a good surplus from fruit blossom, but in the majority of cases this source of income is lost to the bee-keeper through his stocks not being advanced enough at the right moment to profit him by it. The Willow (*Salix caprea*), Hazel, Crocus, and Wallflower, are the most useful of the earliest-flowering plants for pollen-bearing, and any supplement that can be made to the number of these existing in the neighbourhood of the hives would be a gain to the bee-keeper. To follow this subject further into the season, it is utterly useless for any bee-keeper with limited ground at his disposal to grow small patches of honey-producing plants, thinking that his yield of honey will be perceptibly influenced thereby. It is, however, possible for farmers and agriculturists who are bee-keepers, or in sympathy with them, to do useful service in various ways. It would be practicable to systematically prolong the flowering season of the Clovers by having *Trifolium incarnatum* to bloom in May, followed by the white, or Dutch, the succession being kept up nearly to the end of July by Alsike, the latter having been previously cut for greenmeat; or perhaps a few acres could be devoted to such valuable honey-yielding plants as Prickly Comfrey, Lucerne, Sainfoin, Buckwheat, *Melilotus alba*, &c., so as to serve a double purpose by being useful alike to bees and ordinary farm stock.

FEEDING STOCKS, ETC.—The weather having been so mild up to the present, much greater herds will have been made on stores than would have been the case if it had been more wintery, and candy must be given where any insufficiency is suspected. This can either be slipped under the quilt, or placed above it, over the feed-hole, or if a section of honey can be spared, this may be laid over the latter instead of the candy, afterwards covering all up warm and snug. Quits that have got damp should be replaced by dry ones. Keep a look-out, so that mice do not gain an entrance to hives, and prevent tits from taking the bees, either by trapping them, or keeping them from of the alighting-board with wire-netting. *Expert.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

- MONDAY, DEC. 21. { 150,000 Palm Seeds, Lilium auratum, Lilies, Home-grown, Tuberoses, Bulbs, Dutch Bulbs, &c., at Stevens' Rooms.
- TUESDAY, DEC. 22. { Glass Fretions, Hot-water Piping, Boilers, &c., at the Clock House, White Hart Lane, Tottenham, N., by Protheroe & Morris.
- WEDNESDAY, DEC. 23. { Roses, Fruit Trees, Border Plants, &c., at Stevens' Rooms. Large Consignment of Lilies, Begonias, Palms, Bulbs, &c., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—38°.9.

THIS, like most things in America, is to be a "big thing," some five times greater in extent than the last great exhibition in Paris! The last number of the *Journal of the Society of Arts* contains a paper by Mr. JAMES DREDGE, containing full details of the condition and prospects of the Exhibition. As there is a large and increasing trade between this country and the United States in horticultural matters, we deem it well to lay before our readers the following particulars relating to the horticultural department, and to suggest that it would be well for the Royal Horticultural Society to call a meeting of those interested to see in what manner the interests of our horticulturists can best be served.

HORTICULTURAL BUILDING.

"Opposite the wooded island in the lagoon will be erected the Horticultural Building, a great conservatory, 1000 feet in length, and 287 feet in maximum width. The general features of this building are to be a central dome, 187 feet in diameter, and 113 feet high. At each end is a large rectangular pavilion, and these wings are connected with the central rotunda by the main body of the building, each side of which is divided into two courts, 88 feet wide by 270 feet long. The courts facing the wooded island are constructed entirely of iron and glass, and will be used for especially tender plants. The rear courts, while they will receive abundance of light, are not entirely glazed; they will be specially adapted for fruit-growing exhibits which may require a cool temperature. A large section of the courts will be devoted exclusively to the exhibition of Orange culture in California and Florida. The central dome will be chiefly given to Palms, Bamboos, Tree Ferns, Cacti, Eucalyptus, &c. Ten miles of 1½-inch piping will be required to heat the dome alone, and a still greater length will be wanted for the high temperature courts. The ground floor of each pavilion will be chiefly used for fruit exhibits, collections of seeds, and horticultural appliances.

Broad galleries will run around these pavilions about 25 feet above the ground. The greater part of this area will be used for cafés and restaurants, and as the architectural treatment of the buildings includes an exterior arcade running around three sides—this arcade being extended to the upper storey in the pavilions—an additional amount of open-air space will thus be obtained, whence some of the most attractive views in the grounds will be seen. It is the intention of the chiefs of the horticultural department to encourage the best possible displays of all meritorious exhibits in the various groups of pomology, viticulture, floriculture, culinary vegetables, seeds, arboriculture, methods and appliances of horticulture, &c. As the available space is very limited, a careful selection will be made of the objects accepted. The classification of this department will embrace everything of professional interest to horticulturists, whether they are engaged on a large or a limited scale, and there can be little doubt but that the display will give us as great an impetus to the gardener's art as did the similar but much more limited exhibit at the Centennial Exhibition of 1876. Already the applications for space in this conservatory from the United States alone would fill the building several times over, and a system of the most rigid selection is therefore necessary. From Australia and New Zealand, from Latin America, and from China and Japan, applications are already arriving; the most curious exhibits from the last-named country will be the dwarf fruit and other trees, over a century old, and not more than 2 feet high. Many of the States and territories have arranged to make a complete herbarium of their flora, and wax-models of all their fruits; it is the intention of the chiefs of this department to make a great collective exhibit of these objects.

I think that there is every reason to suppose that this section will receive very warm and practical support from English horticulturists. Not only is our pre-eminence in the art fully recognised in the United States, but the importation of plants is not saddled with the heavy taxation that applies to most other objects to that country; in fact, all plants intended for indoor cultivation, for the production of cut flowers, and for decorative purposes, are admitted free. In the same way, many garden seeds are equally unenumerated, and, as will be seen from the following list of exports for 1890, a very large trade is done in them by seed-producers in this country:—

UNTAXED EXPORTS.		Value.
Flower and other seeds	...	£27,000
Trees and plants	...	114,100
TAXED EXPORTS.		Value.
Bulbs	...	73,730
Garden and agricultural seeds	...	60,400
Plants, &c.	...	934,990

It will be within the remembrance of many persons who visited the Centennial Exhibition at Philadelphia in 1876, that the Rhododendron displays made by British growers gained the wonder and admiration of millions of American visitors; this exhibit laid the foundation for a large and constantly-growing trade in this particular shrub, and I was recently informed by one of the chiefs of this department in Chicago—an eminent horticulturist—that, despite the advance that has been made in America in this branch of culture, we still maintain the lead that we had nearly twenty years ago. In 1876 there were less than 1000 nurserymen in the whole of the United States; this number has been increased more than fourfold at the present time, and the trade in

America with cut flowers and decorative plants is enormous. At the beginning of this year there were 4650 floriculture establishments in the United States, with nearly 39,000,000 square feet of glass. The value of these establishments is about £8,000,000 sterling, while the value of the plant sales during 1890 amounted to £2,500,000 sterling, and that for cut flowers to nearly £3,000,000. With this very extensive business, with the acknowledged fact that we, as floriculturists, are far in advance of the United States, and with the very favourable conditions that exist, there is every reason to suppose that in this department, at least, British exhibitors may go to Chicago without the least doubt as to the commercial success of their undertaking.

Before dismissing the horticultural building, it may be added, that extensive grounds will surround it; that these grounds will be laid out in the most elaborate manner, and be adapted for flower displays which will also form exhibits. The art of carpet-bedding has been carried, according to our more sombre eastern ideas, to theatrical extravagance in the United States, and while one cannot but admire the ingenuity which tortures foliage plants and brilliant flowers into "Gates Ajar," terrestrial globes, canoes, sundials, and the like, the British landscape gardeners will probably be content with admiration, and refrain from imitating these curious triumphs of floral decoration."

"THERE is a glut of Apples in the market," said a morning contemporary, the other day; and "the Canadian crop of Apples is this year estimated at a million barrels," an evening journal had previously stated. All this, of course, writes a correspondent, means a bad lookout for low-class English products—first-class will always hold their own anywhere; and in these few words the grower may read his lesson. As time goes on, all the weedy sorts will have been cleared from the market, and Apples worthy of the name will be "worth money," as the saying is. By the month of March next, people will begin to sigh for a toothsome and cheaper Apple, and then—on come the beautiful varieties from Hobart, in far Tasmania. We have been threatened with supplies from Australia; they would be very welcome, but they have yet to be grown, and it is just possible that Australia is not an Apple-growing country. This, however, from all accounts, Tasmania is; we can readily take this for granted, with the vivid memory of what has reached us from that far-off British colony, rapidly rising in importance, for much of which it is indebted to its Fruit-Growers' Association, and the Agent-General, located in the Broadway, Westminster—a gentleman with a firm belief in the future of his country, and quite able to direct the operations of those of his friends at the Antipodes who seek to find favour for their wares in the English markets. A pleasant interview with this gentleman a few days since was productive of much information concerning the Apples of Tasmania, from which we reproduce the following, almost in the words of our informant.

Three years since, the import of Apples into this country from Hobart was some 30,000 bushels; in the year following—1890—the figures had risen to 40,000; this year the importation had risen to 140,000 bushels! It may be stated here that during the season of 1891 considerable space was secured in the cool chambers of steamers loading fruit at Hobart beyond the first-class fruit then at the disposal of the shippers. To

save absolute loss of freight, inferior fruit was shipped, with the consequence that the price fell from the average of 16s. to 18s. per bushel of 1889 and 1890 to 8s. to 10s. in 1891. It has been stated in the English press that the Tasmanian growers are satisfied with this lower rate; but they are not satisfied. The actual cost to the shipper in freight, &c., excluding the price of the

need not anticipate the arrival from Tasmania of any but first-class Apples.

Respecting the area over which Apples are grown in Tasmania, the Agent-General informed us that the acreage under gardens and orchards in 1889-90 was 9808, against 6459 in 1880-81, and this increase is likely to be maintained. It is anticipated, says our informant, that in ten

OUR ALMANAC.—Secretaries of Societies and others are earnestly requested to forward, at once, the dates of show fixtures, and meetings of horticultural societies of any kind for 1892, for insertion in the Almanac to be published in our issue for January 2.

THE LARGE EUCALYPTUS GLOBULUS AT TRESKO ABBEY, ISLES OF SCILLY.—I send you a photograph of the Eucalyptus globulus, a victim of the late gales, which may be of interest to your readers. It was planted in these gardens about forty years ago, and was probably the oldest Gum-tree in England, if not in Europe. The stem, 3 feet from the ground, is 9 feet in circumference. Its height, a very little over 40 feet, the top having been constantly blown off by the wind, which gave it a bushy appearance, in contrast to the usually erect habit of the tree. It was blown down on the morning of November 11, in a severe north-west squall. A well known gardener advised me to clear some of the undergrowth from around it, so as to show the trunk. This I did, with a result that the draught was let in, and half the tree killed; hence, the crevice seen in the illustration. I have been told by some Australians that if you grow a Gum tree in the bush, and cut the bush away, it invariably kills it, and this was the result with one-half of my tree, the other half was apparently improving till blown down, then only one side of the undergrowth was cut away in the case of my tree. Of course, I do not mean you cannot grow Eucalyptus in the open. We only registered frost two nights last winter, and did not lose much—Pelargoniums cut down. I had 500 young *Metrosideros* ready to go out; these were pretty well destroyed; they will not stand frost in their younger stages, but stand the wind better than anything else I know, and grow in rock—anywhere, in fact, where there is ever so little soil. The Palm shown in the illustration, near the Eucalyptus, *Areca Bueri*, was also considerably damaged by the fall of its neighbour. *T. Algernon Dorrien Smith, Tresko Abbey, Isles of Scilly, Nov. 23.*

CHAMBRE SYNDICALE DES HORTICULTEURS BELGES.—At the meeting held on December 8, in the Casino, Ghent, the following plants were awarded First-class Certificates, *Cypripedium (Spicerianum × barbatum superbum)*, shown by M. C. VUULSTÈKE; *Abutilon insignis* Duc de Malakoff *foliis marmoratis*, shown by M. L. DESMET DU VINIER; *Asparagus retrofractus arborescens*, shown by MM. DURIEZ FRÈRES; *Cypripedium insigne* Moense, shown by M. le Notaire MOËNS; *Cypripedium decorum (Sallieri Hyeatum × Lawrenceanum)*, shown by M. J. HYE; *Adiantum nebulosum*, shown by M. E. PANSART; *Cattleya Bowringiana*, shown by MM. BOELEN FRÈRES; *Dracena Veitchii foliis variegatis*, shown by M. E. ERHAUTE; and an Orchid Herbarium, shown by M. A. MEULENAIRE—unanimously.

THE POTTING CONTEST AT MADISON SQUARE GARDEN.—The plants used were really dummies, say *Peter Henderson & Co., in the Florist's Exchange*, as it was impracticable to supply rooted cuttings; we therefore took tips from an Arbor-vitæ hedge, and trimmed them so as to leave them about the size of *Verhena* cuttings. On most of them was left a small "heel" where they were pulled off the main stem, so that they bore as close resemblance to rooted cuttings as could be found. The pots used were 2 inch, of the old style; these were used in preference to the standard pot, because more rapid work could be done with them, the rim on the latter interfering with the transferring of the pots after the plant has been placed in them to the flat. Each of the contestants had a helper, whose duty it was to keep him supplied with empty pots and to take away the flat after it was filled, so that the man who did the potting did not have to stop from the time he began until he finished. Every enquiry we received asked us to explain the motions, and we cannot do better than detail the manner of potting which the two leading contestants adopted. Both of them worked in the same way. In this connection it

FIG. 107.—EUCALYPTUS GLOBULUS IN THE SCILLY ISLES, OVERTHROWN BY THE STORM OF NOV. 11, 1891.

fruit, is over 7s. a bushel, and the 1s. to 3s. remaining over is less than the price which can be realised in the colony. The Government have noticed the mistake of putting anything but first-class fruit on the English market, and there is no probability that the Tasmanian Fruit Growers' Association, which conducts the fruit exports, will allow such a blunder to be repeated. In the season of 1892 and thereafter, the British public

years hence the acreage will be extended to some 12,000 acres. To our thinking the increase will be greater. Our informant hinted at the possibility of an early start in the production of Peaches and Apricots for this market; certainly the fruit would be eagerly bought up if in good condition; and here, surely, what has been done may fairly be accepted as an earnest of what remains to be accomplished.

might not be amiss to say that their style of potting is the same as the late JAMES MARKEY'S, the man who, it will be remembered, potted 10,000 *Verbena* plants in a day of ten hours, and right here it may not be amiss to say that it is a matter of history now that, on a later trial, JAMES MARKEY potted 11,500 *Verbena* plants in a day of ten hours, although this fact was never publicly announced so far as our knowledge goes. GEORGE MARTIN, the man who won the first prize by potting 1277 in an hour, works in this manner. The empty pots are at his left hand, the first motion is to reach for a pot, and at the same instant he takes a handful of soil; placing the pot in position, he unloosens sufficient soil from his hand to fill the pot to overflowing; while doing this he reaches for a cutting, and at the same instant, with the index finger of his right hand, makes a hole in the filled pot to receive the cutting; into this hole, with his left hand, he inserts the cutting to the required depth, and at the same time puts in the remaining soil which he held in his hand, this is to fill the hole. He then takes the pot between the index and middle fingers of both hands, and presses the soil in the pot with both thumbs, first on one side of the cutting, then on the other, to thoroughly fix it. With his right hand he then transfers the pot to the box in waiting, and in doing so reaches with his left hand after another pot and goes through the same operation again. This may seem complicated to anybody who does not use this system of potting, yet nothing can be simpler, and we are satisfied to say that it would be very difficult to improve upon it, as the quality of work done by it will attest. Potting, say, 10,000 plants in a day of ten hours by this system we are satisfied that, when well done, as many plants will grow as if only one-third of it was done, because the motions from constant practice will become so perfect that it is as thoroughly done in a rapid as in a slow manner. The work of the man who won the third prize, DENNIS BRYNES, is rather difficult to describe, as it lacked the system of the other two men, and it seemed to us that he made a great many false movements. Although he did 1238 plants, yet his work was so poor that the judges decided he was entitled to only third prize as against ENRIGHT, who won the second prize with a record of 1155. MR. JACOB D. EISELE, superintendent for H. A. DREER, and MR. JOHN SMITH, superintendent for ROBERT CRAIG, who were two of the judges, said, after it was over, that about one-third of his work should be disqualified. We are satisfied that the main cause of his poor work was the want of a thorough system; his movements were as rapid as those of the other men who won the first and second prizes, and, we believe, with proper training he might equal their record.

THE WEST INDIAN FLORA AND FAUNA.—We take the following extracts from the Report of a Committee of the British Association, charged with reporting on the natural history of the West Indian Islands:—

St. Vincent.—Of the botanical collections received from St. Vincent, the vascular Cryptogams have been determined by MR. J. G. BAKER, F.R.S., and an account of them, with two plates, printed in the *Annals of Botany*, vol. v. (April, 1891), pp. 163-172. Amongst the Ferns, the most striking novelty is a new species of *Asplenium*, named *A. Godmani*, BAKER (pl. xi.), found in damp forests at the extreme top of Morne à Garou. Other new species are *Hymenophyllum vincentinum*, BAKER (pl. x.), and *Acrostichum* (*Elaphoglossum*) *Smithii*, BAKER. The total number of vascular Cryptogams found recently in St. Vincent amounts to 163 species. Most of these are widely spread through tropical America, and only four are endemic. In addition to the above, a new species of *Hepatica*, also from St. Vincent (*Kantia vincentina*, C. H. WRIGHT), was described in the *Journal of Botany*, vol. xxix. (April, 1891), p. 107. Of the Phanerogams from St. Vincent and some of the Grenadines, the work of determining these is being carried on as expeditiously as circumstances permit. The collection is a very large

one, and the results so far attained are recorded in the following memorandum prepared by Mr. R. A. ROLFE:—"The flowering plants have been determined as far as the end of Rutaceæ. Those from St. Vincent number slightly over a hundred species, of which about thirty, consisting for the most part of common West Indian plants, were not previously recorded from the island. The most interesting plant is a species of *Trigynia* (apparently new), a small tropical American genus of Anonaceæ not hitherto detected in the West Indies. A *Clusia* and a species of *Tetrapterys*, which cannot be identified, may also prove new. The remainder have been fully determined. The three most interesting of these are *Norantea Jussiei*, TR. and PL., previously known only from Guadeloupe and Dominica; *Zanthoxyla microcarpum*, GRISEB., from Dominica and Trinidad; and *Z. spinosum*, SW., from Dominica, Jamaica, and Cuba. The composition of the flora of the Lesser Grenadines, situated between St. Vincent and Grenada, was previously almost unknown. The plants hitherto determined are as follows: From the Island of Bequia, thirty-four species; from Mustique, eighteen; from Canouan, five; and from Union, the nearest to Grenada, five. They are, without exception, common West Indian plants, and are all also natives of St. Vincent. From the results hitherto obtained, it seems clear that the flora of the Lesser Antilles is tolerably uniform throughout, although the larger islands of Dominica, Martinique, St. Lucia, and possibly St. Vincent, appear to have each a very small endemic element."

Grenada.—The collections made by MR. SHERRING at Grenada consist of nearly 6000 specimens of vascular Cryptogams, and about 1000 specimens of Phanerogams. The number of species of Ferns is about 140, and of these two are new, viz., *Alsophila Elliottii*, BAKER and *Acrostichum Sherringii*, BAKER. The Phanerogams have not yet been worked out. Sixty species of Ferns were previously known from Grenada from collections made by Mr. G. R. MORRAY, F.L.S., and Mr. W. R. ELLIOTT. MR. SHERRING has increased this number to 140. The species of greatest interest, other than those known to be new, are *Asplenium Godmani*, BAKER, recently found in St. Vincent; *Polypodium Hartii*, JENMAN, first described in 1886, and known only in the mountains of Jamaica and Dominica; and *Acrostichum Aubertii*, widely spread in continental America, but new to the West Indies. Other interesting plants collected by MR. SHERRING are *Schizæa fluminensis*, MIERS, new to the West Indies, but believed to be only a shade variety of *S. dichotoma*, and *Danæa polymorpha*, LEFRIEU, a critical form of which but little is known.

PROPOSED GARDENERS' INSTITUTE FOR NEWCASTLE.—At a meeting of the Newcastle and District Horticultural Mutual Improvement Society held at the Lit. and Phil. Inst. under the chairmanship of Mr. HESLOP, the committee, per Mr. J. HOOD, jun., Hon. Sec., reported in favour of establishing a Gardeners' Educational Institute in Newcastle.

M. CRÉPIN.—The Director of the Botanic Garden at Brussels, the main-spring of the Royal Botanic Society of Belgium, whose quarter-of-a-century of work was, as we mentioned in our last issue, celebrated on the 6th inst., at Brussels, is well known by his excellent manual of the Belgian flora now in its fifth edition, by his admirable *Manuel du Botaniste*, which should be in the hands of all botanical students, and particularly by his numerous publications on the genus *Rosa*—one of which, a most acceptable summary, was first published in the *Journal of the Royal Horticultural Society* on the occasion of the Rose Conference in 1889. In addition, M. CRÉPIN has been an ardent student of fossil botany. These and other services to botany and to horticulture were alluded to by Professor GRAVIS, of Liège, who presided at the meeting to which we have already alluded—a meeting at which a "Prix Crépin" was established. The Minister of Agriculture endorsed Professor Gravis' eulogium, and

M. DOUCET called attention to the services rendered by M. CRÉPIN to the Botanic Garden at Brussels since the period of his appointment, in 1876. M. DE SÉLYS LONGCHAMPS, speaking on behalf of the Academy of Sciences, echoed the praises that had been uttered by other speakers, whilst Professor BERTRAND, of Liège, became the interpreter for the foreign botanists desirous of adding their testimony to the value of the work of M. CRÉPIN. In his reply, M. CRÉPIN alluded to the years he had passed in the School of Horticulture of Ghent, and the advantages he had received from such men as DOMORTIER and VAN HOUTTE. The banquet was necessarily to a large extent a repetition of the morning's formal proceedings, but a dramatic touch was afforded by the Minister of Agriculture affixing to the breast of M. CRÉPIN, the insignia of Officer of the Order of Leopold. This was received, our correspondent says, with "explosions of enthusiasm, and frenzied applause"—it was after dinner! Count KEACHOVE DE DENTERGHEM presented, in the name of the staff of the *Revue de l'Horticulture Belge*, of which M. CRÉPIN is an old contributor, a magnificent bouquet. That is the way things of this kind are done in Belgium. We cannot equal our friends on the other side of the Channel in manifestations of this kind.

MR. W. J. GRANT.—We greatly regret to learn that Mr. W. J. GRANT, whose appointment by the Monmouthshire County Council to superintend the Departments of Agriculture, Horticulture, and Forestry, was notified in our issue for August 15 last, met with severe injuries on the railway near Monmouth, having been struck by an engine, fracturing the base of his skull.

THE TRADE IN FRUIT BETWEEN FRANCE AND GERMANY.—We read in the trade notices in MÜLLER'S *Gärtner Zeitung*, that, according to a recent official statement, the total imports into France of table fruit for the year 1889 is valued at 64,000,000 fr., and the imports in 1890 at 83,000,000 fr. Against these figures, there was an exportation of 32,000,000 fr. in 1889, and 38,000,000 in 1890. German imports of table fruits amounted to 23,261 double cwt., in value 673,391 fr., whilst France exported to Germany 52,972 double cwt., in value 3,124,733 fr. The fruit imported into France costing per double cwt. 30 fr., whilst that exported to Germany was reckoned at 60 fr.

GARDEN DIRECTORIES.—Two of these indispensable handbooks have reached us, viz., the *Horticultural Directory and Year Book for 1892*, from the office of our contemporary, the *Journal of Horticulture*, 171, Fleet Street; and the *Garden Annual and Almanack*, from the Garden Office, 37, Southampton Street, Strand. Both contain very complete lists of gardens, with the names of the gardeners who have charge of them. Also lists of the new plants that have received Certificates from the various large societies during 1891, and much information that is of value to all who may be engaged in horticulture and horticultural journalism.

THE MIDLAND CARNATION AND PICOTEE SOCIETY.—The committee have issued their first annual report, in which they say that the prospects of the Society for 1892 are most encouraging. The committee's great hope and ambition is to have an annual exhibition that shall be one of the most representative in the kingdom, and that everything possible shall be done to encourage the small as well as the large growers. They request, in consequence, suggestions for any improvement to the present existing state of things. The Botanical Society of Birmingham have offered to hold the show again in their gardens. The Society have under consideration the desirability of giving special certificates to all meritorious honorary exhibits, also silver and bronze medals for any exhibits of superior merit, somewhat after the style of those of the Royal Horticultural Society of London; but as these will only be awarded where the exhibits distinctly deserve it, the committee hope that these medals may be

looked upon as of great value from an exhibitor's point of view.

THE BOTANICAL LIBRARY AT KEW.—In the current number of the *Bookworm* is a lengthy account of the library at Kew, from which, when the exigencies of our space permit, we may be tempted to make some extracts.

IMPATIENS HOOKERI.—The above plant, of which a shoot and flowers were kindly sent for our inspection by the head gardener at Chatsworth, has some value as a decorative plant at this season. Mr. N. E. BROWN, of the Royal Gardens, Kew, to whom we forwarded the flowers and shoot of the plant, in his reply to our note, says:—"The name is correct, but I do not remember to have seen it in flower before; probably it would do so freely enough, if kept pretty dry, in a dry hot atmosphere, and exposed to the light as much as possible for a few weeks each year."

TECHNICAL EDUCATION.—It may interest some of our readers to know that Messrs. NEWTON & CO., the opticians of Fleet Street, have in course of preparation sets of slides for lanterns for the use of lecturers giving technical instruction in various subjects.

"BOTANICAL MAGAZINE."—The 117th volume now completed is dedicated by its Editor, Sir JOSEPH HOOKER, to Sir MOUNTSTEWART GRANT-DUFF, latterly Governor of Madras, and who when Under-Secretary of State for India, and afterwards for the Colonies, rendered important services to botany and horticulture.

— The December number contains figures of the following plants:—

Agave albicans, t. 7207.—Leaves oblanceolate mucronate, finely toothed, with a central stalk bearing a dense cylindrical tuft of purplish flowers.

Bolbophyllum macranthum, t. 7208.—A curious species, with creeping rhizome, oblong-acute leaves, one-flowered peduncles, flowers more than 2 inches in largest diameter: flat segments, lanceolate, spotted; lip narrow, curved, jointed in the middle. Mr. RIDLEY gives an interesting account of the method of fertilisation, of which a summary is here given.

Trochetia Blackburniana, t. 7209.—A highly interesting shrub, with oblong, strongly-ribbed leaves and stalked flowers, like those of an *Abutilon* in form, white, deeply tipped with crimson. The plant is a native of Mauritius, in the Indian Ocean, its congeners being found only in Madagascar and in St. Helena, in the Atlantic Ocean. The species are thus separated by 2000 miles of ocean and the interposed continent of Africa. How the distribution was effected, and whether any species are or were once in existence in the intermediate territory, are matters for speculation. This curious plant flowered in the garden of Trinity College, Dublin, under the care of Mr. BURRIDGE.

Veronica Lavanduliana, t. 7210.—A shrubby species, figured in *Gardeners' Chronicle* of the present year, i., p. 934, fig. 154, from specimens grown by Mr. BURRIDGE in the Trinity College Botanic Garden, Dublin.

Arisema anomalum, t. 7211.—A species with a perennial root-stock, solitary, three to five-foliolate leaves, and stalked inflorescence, with a purplish spathe marked with white veins. See *Gardeners' Chronicle*, 1890, vol. i., p. 321.

AMBROSE BALFE—It is with much regret that we have to chronicle the death of this gentleman, which took place at his residence, 28, Westland Row, Dublin, on the 7th inst., at the age of seventy-seven. Mr. BALFE was for many years the genial and efficient Secretary of the Royal Horticultural Society of Ireland, and also for a considerable period he edited the horticultural columns of the *Irish Farmers' Gazette*. Originally educated for the church, he elected gardening as his profession, and, as many other celebrated horticulturists have done, he graduated in the College Botanical Gardens, at Ball's Bridge. Here he met as young

men, or in their prime, many who in after life were most successful, such as the late Dr. DAVID MOORE, Mr. CHARLES MOORE, his brother, now Director of the Sydney Botanical Gardens; the late Dr. J. T. MACKAY (*Mackaya bella*); FRASEN, the landscape gardener and author of a capital road-map of Ireland; WILKIE, then Superintendent of the Phoenix Park; the late Mr. NINIAN NIVEN; Professor WM. HARVEY, M.D.; Mr. JOHN BAIN, A.L.S., and many others. The late Archbishop WHATELY was a constant visitor to the garden in those days, and many are the stories still told of his witty and original manner. Mr. BALFE was a sound botanist and gardener, and took many prizes during the palmy horticultural shows held in the Rotunda in former years. He was one of the first observers to direct attention to the sclerotia of the Potato fungus. He had retired from the secretaryship of the Royal Horticultural Society of Ireland some time previous to his death, and his loss will be much regretted by all who knew and respected him—and they were many.

THE PHARMACEUTICAL SOCIETY.—The first evening meeting of the society in Edinburgh was marked by an excellent address from Professor BAYLEY BALFOUR. He took as his subject "Botanical Enterprise in Relation to Pharmacology." After referring to the origin and functions of botanic gardens, and their relation to Pharmacy, the Professor gave an admirable summary of the work done at Kew in collecting and diffusing not only useful information but also the plants themselves. The story has often been told with admiration in these columns, and we are pleased to find in other quarters so just an appreciation of the work of Kew in departments that the general public was not of.

NEW BOUQUET-HOLDER.—Messrs. J. TAVERNER & Co., of Mount Street, Grosvenor Square, have introduced a new holder for an opera bouquet, of which a figure is given in the *Queen*. It is made flat on one side, so that it can be laid on an opera-box cushion or elsewhere without injury to the flowers. The holder is in shape like a "sugar-paper," slightly cut down at the top in front to form a sloped aperture for the flowers, and left high at the back to support them.

IRON v. WOOD FOR GLASSHOUSES.—The tendency in America, as we learn from *Garden and Forest*, is steadily toward the most durable material for greenhouses. The fear of losing heat by radiation from metal is considered groundless.

THE LATE GALES.—Much damage has been done in parks and gardens in the western and southern parts of the country. In South Wales, the force of the wind approached that of a tropical cyclone. In one case, a glass-house 350 feet by 20 feet, erected last spring, was, with several others, completely overturned by the force of the wind. The big house contained 6000 flowering Chrysanthemums, which of course were ruined. At Sion, the Duke of NORTHUMBERLAND's residence in Brentford, much damage was done, and amongst other trees blown down was the old *Sophora japonica*, which had long been in a crippled condition, and bound together with about one ton of iron chains, bands, &c.

HORTICULTURAL CLUB.—The periodical monthly meeting was held at the Club-rooms, Hotel Windsor, on December 8, the chair being occupied by Mr. JOHN LEE. There was a good attendance, and amongst those present were the Rev. W. WILES, the Rev. F. H. GALE, Messrs. CHEAL, DRURY, C. E. PEARSON, A. H. PEARSON, &c. The Rev. W. WILES gave an interesting lecture on "Fruit Trees in Pots."

ROYAL HORTICULTURAL SOCIETY'S MEETINGS IN 1892.—Following are the dates of the committee meetings and shows for the forthcoming year:—January 12; February 9, annual general meeting; March 8 and 22; April 12, April 19 (Auricula and Primula show); May 3 and 17; 25 and 26 (Temple Show); June 7; 21 (Rose show); July 12; 26

(Carnation and Picotee show); August 9; 23 and 24 (exhibition and conference on Begonias, Apricots, and Plums at Chiswick); September 6 and 20; October 4 and 18; November 1 and 15, December 13.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The fifty-third annual meeting will be held at SIMPSON'S, 101, Strand, on Friday, January 15, at 3 P.M., for the purpose of receiving the annual report and of electing seven candidates. Six others will be placed of right on the list by virtue of their previous subscriptions. We regret to find that the total number of candidates is not less than thirty-five, whilst as above stated, only thirteen can be elected. The necessity for increased support is thus made manifest, and we most earnestly hope it will be forthcoming. The Secretary's address is G. J. INGRAM, Esq., 50, Parliament Street, London, S.W.

NOTICES OF BOOKS.

BRITISH FUNGI: PHYCOMYCETES AND USTILAGINEÆ. By George Masee. (L. Reeve & Co.)

The two groups of which Mr. Masee has here undertaken to give an account are of interest alike to the botanist and to the cultivator. They comprise many forms which are most injurious, e.g., the Potato mould (*Phytophthora*). The time has gone by when the mere inspection of a fungus by the aid of a pocket lens or even of a compound microscope was deemed sufficient. Nowadays it is requisite to trace the life history of every species, from its earliest stage to the period of maturity. In many cases there is no direct continuity of form and appearance, but the plant in one stage of its growth is totally different to what it is at another; moreover, its habits and mode of life are correspondingly different. To study such plants successfully, it is therefore needful to cultivate them and watch their progress in every stage and under every variety of condition. All this has only been made out, broadly speaking, within the last quarter of a century, and, of course, only a fragmentary portion has yet been studied in this exhaustive manner. To those who have to deal with the numerous diseases of plants, to prevent or palliate the injuries inflicted by parasitic fungi, such a study is essential. The facts, as, for instance, that a mould like a *Botrytis* can have any genetic relation with a *Peziza*, are so surprising, that we need not wonder if they appear incredible to some folk, but as the facts become more and more established and a new generation arises, to whom they will be familiar, so we may confidently expect that the power of dealing with these pests will be strengthened. Mr. Masee's little book, though it deals with a limited portion only of the subject, will serve as an excellent introduction, and as such we heartily commend it to the student.

THE EVOLUTION OF PLANT-LIFE, LOWER FORMS.

By G. Massee. (Methuen & Co., 18, Bury Street, London.)

In this little work, after a preliminary chapter dealing with the general characteristics of plants, the author proceeds to show what has been and is the probable course of development from simple to complex. He begins with the Mycetozoa or Myxomycetes, a group which, nevertheless, he concurs with others in assigning to the animal, rather than to the vegetable kingdom. Of almost equally doubtful position are the protophytes or bacteria and their allies. From these we pass to groups whose nature is not doubtful, such as the Diatoms, the Protococcus, and from these we proceed gradually upwards to the brown Seaweeds, which are distinguished by the presence in their tissues of sieve-tubes and sieve-plates, such as occur in the bast of higher-flowering plants. As to lichens, the author adopts freely the notion of the interdependence of the fungus and the alga, the alga supplying from its chlorophyll what the fungus otherwise would not be able to obtain. A "perfect balance and division of labour between two originally distinct plants, to form a third possessing marked peculiarities of its own, with a corresponding loss of the individuality of its components, suggests to the mind the analogy with the formation of a chemical compound." Whether this relation is anything more than a superficial analogy remains to be seen.

The author, as will be seen, ranges the orders in the sequence in which he presumes them to have originated, but beyond this he does not offer much evidence from embryology and other sources as to the actual course of events. Nevertheless, Mr. Massee's book will be very serviceable to those who desire to obtain a general notion of the principal groups of plants and their sequence.

MANIPULATIONS DE BOTANIQUE MÉDICALE ET PHARMACEUTIQUE. Par MM. J. Heraud et Valère Bonnet. (Paris: Baillière.)

This work, though especially addressed to druggists and doctors, may also be recommended to botanists in general, whilst it is not without interest even to horticulturalists. The introductory chapter gives a good account of the minute anatomy of plants, and of the manner in which it should be studied by microscopical and by chemical means. Then follow details concerning the minute anatomy of the roots and other organs of plants, illustrated by excellent woodcuts. The latter half of the volume is filled with special details relating to the anatomical structure of drugs in common use, such as Sarsaparilla, Valerian Jalap, &c., the descriptions being supplemented by excellent plates, showing the minute structure. These are useful in affording means for the detection of adulteration, and are of great importance with reference to the conditions under which plants grow, and therefore as to the manner in which they can most effectively be cultivated.

SELECT EXTRA-TROPICAL PLANTS READILY ELIGIBLE FOR INDUSTRIAL CULTURE OR NATURALISATION. By Baron Ferdinand von Mueller, K.C.M.G., &c. (Melbourne: Printed for the Victorian Government by C. Troedel & Co.). Price, 5s.

The eighth edition of a book, which has been translated into German and French, adapted for Indian climates and modified for that of New South Wales, needs no recommendation. The mere mention of a re-issue is all sufficient. A book of this character, though to a large extent a compilation, is one which demands unusual knowledge and consummate judgment on the part of the compiler. Its great success indicates that these requisitions have been met. Indeed, it is a book which should not only form part of the library of every cultivator, but one which should be on the shelves of all those in any way interested in economic botany. As a condensed encyclopædia of the latter subject, the book, within its prescribed limits, has a value for a class of readers as numerous, or more

so, than those for whom it was more immediately destined. Those plants which are of special interest or value are marked by an asterisk. In all, 2485 plants are mentioned, besides very many others, of which incidental mention only is made. In the appendices, details are given as to the temperature and rainfall in various parts of the colony of Victoria. Lists are also supplied of the genera, arranged according to the purposes for which they are used, alimentary, textile, constructive, medicinal, and so on. A systematic index is also provided, in which the genera are arranged under their respective natural orders. A list of synonyms and a geographical index follow, and these are succeeded by detailed lists of plants which furnish a crop in one, two, three, or more years, as the case may be. Plants adapted for very cold or very dry regions are separately enumerated, whilst the work ends with an index of vernacular names. The mere mention of some of the contents of this volume is sufficient to justify our remarks as to its utility. But its author is not yet satisfied, nor, indeed, would he or could he ever be. Accordingly, we find him, while approaching the eighth decade of his life, hoping not, indeed, that he may see "many more editions of this work brought up to the newest standard," but that he may "perhaps still be able to publish one more edition before passing away." To this end he solicits that assistance which all who are able will cheerfully give to so valiant and indefatigable a worker as Sir Ferdinand von Mueller.

BRITISH EDIBLE FUNGI: HOW TO DISTINGUISH AND HOW TO COOK THEM. By M. C. Cooke, LL.D. (Kegan Paul, Trench, Trubner & Co.)

Thanks to the zeal and energy of fungus-hunters, public interest in these plants is increasing, and people are manifesting that interest in a practical fashion. The necessity for caution in discriminating the wholesome species from the poisonous ones has had the good effect of stimulating observation and intelligence. Some not inconsiderable risk is thus compensated for by the increase and diffusion of knowledge. Sixty-five species are mentioned by Dr. Cooke as having been tried by him, so that he is a guide who may be safely followed on the score of practical experience. As to scientific competency, Dr. Cooke is too well known to fungus-lovers for any doubt to arise on that score. In the present book, the explanations and descriptions are given with the clearness and authoritativeness begot of long experience.

While certain species are unmistakably injurious, it is open to doubt whether in many other cases the injurious effects are not due to the method of cooking. Excess of butter and toughness of texture alike create symptoms of indigestion, as we had lately the opportunity of observing in the case of the Horse Mushroom, which is universally allowed to be harmless, but which if badly cooked, or too freely partaken of, is capable of inducing unpleasant symptoms.

With some experience of edible fungi, though less in extent than Dr. Cooke's, we venture to think the forced Mushroom of the gardens is by far the best of all the tribe. Next in goodness we should class the great white puff-ball, *Bovista gigantea*, which is so unmistakable that a blind man could not mistake it, and which has a peculiarly delicate flavour. *Agaricus procerus* and champignons are by no means to be despised, but some of the fungi over which enthusiasts expend their superlatives are, to our palate, not worth the trouble entailed in cooking them—for instance, the beef-steak fungus. But this is only a matter of individual opinion. We should gladly hear of the more general use of fungi for food, provided the picking out of the wholesome species could be done with facility. The present book will serve that purpose excellently, for the descriptions are clear, and great care has been taken to guard against errors and mistaken identifications. The text is, moreover, supplemented by several excellent coloured illustrations, concerning which we have only to express our regret that no scale of proportion is given. About the time when this article was penned, we had before us a specimen of *Agaricus*

procerus three times the size of the one figured on tab. 2, inasmuch that we had difficulty in persuading others that the species was really the same.

Ample details are given as to the various methods of cooking fungi; the necessary preliminaries of collecting them are also dealt with, the author giving full information as to the locality and season at which particular species may be expected. A good index completes what we may commend as an interesting and trustworthy book.

FÖRSTLICHE BOTANIK. Von Frank Schwarz. (Forest Botany.) (Berlin: Paul Parey.)

This is a compact volume, devoted to the subject of forest botany, and comprising in the introductory chapters details concerning the structure of plants and the morphology of their organs, copiously illustrated with excellent woodcuts. Among them we find, at p. 69, an illustration of the perforation of a young Oak plant by the rhizomes of the common Twitch, *Taticum repens*. We have frequently seen such a transfixion in Potatos, but have not observed them in seedling Oaks. The manner in which this was effected has also recently been elucidated. The construction of the wood, of course, receives special attention. A separate section is devoted to the physiology of trees, and another to wounds and injuries from frosts, insects, fungi, &c. A general view of the vegetable kingdom is then given, beginning with the fungi, and going upwards, the illustrations being naturally such as have special reference to forestry. The illustrations in this part of the volume are specially good, and render the volume of value even to those who do not read German. The geographical distribution of plants, and the climatal conditions under which they grow, are treated of at some length. The chapter devoted to this subject is followed by a series of synoptical tables, constructed for the purpose of facilitating the recognition of trees by means of their leaves or buds. The seedling plants are duly described and figured, and the work ends with a description of the appearances of the wood in the principal forest trees. A copious index completes a book of great value to the student of forestry.

A MARKET-PLANT COLONY.

Amongst the earliest settlers of what has now become one of the most noted market-plant, flower, and fruit-producing districts or colonies about London, that of Hampton, Middlesex, is Mr. Denning, an well known amongst gardeners some years ago, and still a prominent member of the Floral Committee. I called upon him the other day, finding his place eventually, after some difficulty, the chief of which was found in the state of the roads and lanes, such as would have disgraced a backwoods' trail, and was absolutely inconceivable in a suburban district, under that modern governmental blessing in disguise—a Local Board. About Mr. Denning's neighbourhood have clustered several other not unknown gardeners, amongst whom are Mr. Horsefield, formerly of Heytesbury; Mr. Bowlea, of Richmond; Mr. Heickle, of Twickenham; and others. "We have just started to day the beginning of the twenty-ninth market-plant and flower-growing establishment on this Tangley Park side of the Thames Valley Railway," said Mr. Denning, "and all these have sprung up within very few years." Then over on the New Hampton side of the line are many others, so that it is no exaggeration to say that fully fifty of these market-places, many of them having very extensive areas of glass, are now within the boundary of Hampton parish. The Cockney term, "happy Hampton," has now lost its old significance, but it does seem to present to the market-grower a sort of happy hunting-ground for his particular purpose. I asked Mr. Denning to give a reason for this particular flocking together of birds of a feather, and he said that he thought it was due chiefly to the excellent atmosphere of the locality. Hampton is, as the crow flies, perhaps not more than from 10 to 12 miles from the most populous western and

southern metropolitan districts, and under ordinary circumstances would have between it and London various populous small towns and suburbs; but it so happens that, between Hampton and London, there exists, and will so remain for a long time, various great open spaces, such as Bushy Park, Hampton Court Park, Richmond Great and Home Parks, and Kew Gardens, and more to the right, Wimbledon Common; so that, whatsoever of a foul or smoky atmosphere may pass south or south-west from London, is, in passing over these wide, open areas, materially purified, hence the Hampton fogs are not prone to be nearly so black or sooty as they are in other districts. Of course, the theory may be taken for what it is worth. One thing, however, seems certain, and it is, that the district is endowed with a fine deep, retentive soil; and, judging by the awful condition of what seemed to be cinder-dressed roads, gravel must be at a premium. However, there is the fact, that the district is being literally settled by market growers, and whether there be room in the market for more of plants, flowers, and fruits, or not, there is area at Hampton for plenty more of plant and flower establishments. Mr. Denning has eight large span-houses, all devoted to the produc-

tion of flowers for cutting—that is his particular forte. It seems generally to be the case, that at Hampton particular fortes are found to pay best. The latest of the eight houses just erected, 65 feet by 20 feet, and a light graceful span, is to be specially employed for winter-forcing of bulbs, Spiræas, Lilacs—in fact, of anything which will force well and give good results. This house has in it not fewer than twelve rows of 4-inch piping, to furnish the heat-making with, and turns and feeders about 600 feet, enough to maintain a very high-forcing temperature with ease. Mr. Denning, who does all his own building and heating, holds that it is far wiser to have an abundance of piping, so as to maintain a high temperature in the coldest of weather, than to be firing hard all night, and living in a state of anxiety lest the boilers should fail. The boilers used are saddles, but set so that the flues carry the smoke first over and beneath the boilers, so that all the warmth from the fire is fully utilised. Fires banked up at 9.30 p.m. in the hardest of weather keep up the required warmth all the night without difficulty. In the new house there is a block of four pipes along the centre, and the plants were either stood on the floor, or on a stage above. On either side of the house brick-pits have been made, about 3 feet wide. In the bottom of each run a couple of pipes to give bottom-heat, and at

FIG. 108.—CENTAUREA MARGARITÆ: FLOWERS, PURE WHITE.

the back, nearly up to the glass, are two other pipes. Such a house will force flowers, grow pot-Vines, Melons, Orchids, or anything needing a high tropical temperature. There is a huge cistern in the floor of the house also, for plenty of tepid water is essential. In another house there was a large batch of Japanese Chrysanthemum Fulton, a rich deep yellow. These plants bloom most profusely rather later than the general run of yellows, and the flowers are highly favoured in the market. Anything more charming for domestic floral decoration than bunches of Fulton can hardly be conceived. Full flowers are grown, too, but not yet very largely, and C. Mr. H. Cannell is being tried, although its incurved flowers do not look so pleasing as are those of C. Fulton. Of white Chrysanthemums, the sorts grown are Elaine, Lady Lawrence, practically a white incurved Japanese, but exceedingly fine and pleasing; and a tinted white sport, which Mr. Denning has obtained, but not yet named, not unlike a very broad-petalled Elaine, that produces fine clusters and blooms profusely through December; this will, no doubt, in time make a standard Christmas blooming variety. Gardenias are very finely done, nearly an entire house is devoted to these, the centre being filled with huge

plants reaching to the roof in 14-inch pots, in splendid condition, and covered with flowering-buds. These plants are kept from five to six years, and then are succeeded by younger ones, of which there is a fine batch in 9-inch pots. Callas, too, are wonderfully well done, a big batch now flowering freely. I noticed that all the plants were stood upon other inverted pots, and Mr. Denning said, when asked for an explanation, that it was difficult to give a practical reason for the procedure, but that he had always found the plants to thrive better when elevated from the floor than when stood upon it. Winter-blooming Carnations are largely grown, the best being the primrose-coloured Andalusia, a pure white sport from it, and wonderfully free; Miss Jolliffe, and the deep scarlet Lucifer. Raspail; double-scarlet Pelargoniums, in 6-inch pots, form a perfect mass of foliage and flowers; and the Ivy-leaved double-flowered Pelargonium, Madame Carousse, trained overhead just at the doors of several houses, gives very beautiful bloom all the year round. Paper-white Narcissi, planted thickly in boxes, stand on the floor of one house blooming abundantly, so also do Tuberoses; and of Tea Roses the best are Niphetos, and Souvenir de S. A. Prince, white, and the ever-beautiful pink Catherine Mermet, which is largely planted out; Eucharis amazonica is well done; and of

Bouvardias the rich-coloured President Cleveland is the most favoured, and yet in abundant bloom.

Stephanotis floribunda grows most freely, and could, if needed, fill houses in no time. There seems to be no evidence of scale or other parasite about this plant, or any other indeed, Mr. Denning laughingly asserts, that such creatures are not acclimatised at Hampton. He has gone in for numerous Orchids also of late, having a big collection, but still in small pots, of Dendrobes, Cattleyas, &c., and some big pieces of Coelogynes. These give a good return in bloom in proper season. In one house were growing Tomato plants, some 4 feet in height, and not only blooming well, but carrying fruits, which should be ripe at Christmas. It looked as if this lot of plants would thrive well. I noticed that they were not put out on to any made border, but planted in holes made in the hard raised soil, on which plants had been standing all the summer, that may be conducive to the present fruitful aspect of the plants. A. D.

CENTAUREA MARGARITÆ.

THROUGH the kindness of Messrs. DAMIAN & Co., San Giovanni a Teduccio, near Naples, we are enabled to portray a very pretty novelty in the form of a variety of Centaurea odorata, with pure white fragrant blossoms. The plant is an annual or biennial, according to treatment, and offers excellent material for pot culture, beds, and bouquets (fig. 108).

HOME CORRESPONDENCE.

ELMS FOR AVENUES.—In your Notice to Correspondents in the *Gardeners' Chronicle* for December 12, I notice the names of several varieties of Elms for an avenue. Your correspondent, I think, omitted to name the Chichester, or as I believe, it is sometimes called the Cornish Elm. During the past autumn I was staying at Eastbourne, and was much struck with the Elm avenue in the streets and also in Devonshire Park, this I took to be the Chichester Elm, and if I am right in my judgment I consider it one of the very best for planting in towns, or for avenues generally. J. B.

— I would suggest to "J. M." that a great number of varieties of Elms planted in the same avenue, would, when they came to maturity, show considerable differences in the width of head and height, and prove very unsightly. "J. M." can have variety—but I would recommend him to plant either a collection of the large and wide-branching varieties, or choose the smaller Elms. For an avenue of large and spreading trees, I would recommend *Ulmus campestris*, *U. montana* the Wych Elm, the Huntingdon, and *U. alata* the Winged Elm. The smaller species of Elm which grow into pyramidal form are *Ulmus stricta*, Cornish Elm (in some nurseries called the Jersey Elm), Dutch Elm, and *U. parvifolia*, a small-leaved variety. I have planted a number of avenues of Elms, and if I can render "J. M." any assistance in this matter, I have requested the Editor to give him my name and address. Forster, Hereford.

WINTER HELIOTROPE.—Coltsfoot, *Tussilago fragrans*, or, as it is sometimes called, *Petasites fragrans*, is flowering uncommonly well on a border with an eastern aspect, where there are clumps of it about 8 feet square. In our heavy soil it thrives amazingly, and in a mild autumn flowers abundantly. The present seems to have suited it well; it does not mind rain, although the flowers look a bit bedraggled; a few hours' of drying wind soon restores them. It is one of the few flowers to be had out-of-doors at this season, and for that reason deserves to be planted about a garden. It will succeed fairly well under the shade of tall deciduous trees, but, of course, it is much better in the open. E. Molyneux, Swanmore.

CHRYSANTHEMUMS.—We send you a few flowers, in different stages of blooming, of a Chrysanthemum we have growing here. The parent-flower is deep yellow, called with us "Golden Horn one." It sported last year, and we have since grown the sport from cuttings, and the plants have continued true to the sport. You will observe the young flowers come tinted yellow, expanding as they grow into pinkish-white. We think it a very pretty sport,

but will be glad to have your opinion of it, and whether it is worth propagating. *R. & A. M.* [A pretty Pompon, which we should think is worth propagating. Ed.]

DR. HOGG PEACH.—I planted in the year 1885, in a midseason house, a tree of Dr. Hogg Peach, which grew luxuriantly, but set a few fruits in 1888 and 1889, which dropped in stoning. I adopted the usual treatment in such cases, and got it to carry in 1890 about thirty-six fruits, which were gathered at the end of August, and of which one weighed 17 oz., and several over 12 oz.; the flavour, however, was not very good. This last season it set its fruits fairly well, and these I reduced to sixty, at about 1 foot apart. They appeared fine healthy fruits of about 6 to 12 oz. weight, but not one of them ripened. I cut several right through, and found the flesh spongy, tough, and discoloured, and consequently worthless. Should any reader of the *Gardeners' Chronicle* have grown this variety, I should feel obliged if he will kindly give his opinion of its merits and failings. I may state that its neighbour, a Noblesse, had fruit which for size and flavour could not be easily beaten. I read with interest the correspondence of Mr. Divers, Mr. Shepherd, and others this year on the subject of Peach growing, and perhaps they will kindly give me their valuable advice. *J. Blayne, Huntley Manor Gardens, Gloucester.*

LARGE PITMASTON DUCHESS PEARS.—Your correspondent, of Barton Seagrave, writes of some heavy fruit of the above Pears, and we have here two trees on a wall facing south-west, from which were gathered on October 17 ninety-five fruits from one, and forty from the other. The six largest weighed 8 lb. 6½ oz., two of them turning the scale at 3 lb. One measured 7½ inches, the other over 7 inches in length. The total weight of the 135 fruit was 125 lb. The trees were planted in 1881 by Mr. Howe, the late gardener, who exhibited fruit from them, and secured 1st prize several years. The fruit from one of the trees resembles the old Duchess in form and colour, but in flavour they are identical. The trees received last autumn copious supplies of manure-water. *J. Howard, Benham Gardens.*

— I have two trees of this variety of Pear, one of which was planted three years ago. The tree produced this year 120 good fruits, of which six weighed 6½ lb., and some were sold to a local fruiterer, who got 7d. each for them. In planting my trees, I always put some brickbats or other hard material at the bottom of the hole, and keep the roots as near the surface as possible. Our soil is about 18 inches deep, resting on gravel. This tree is planted by the side of a walk with an arched wire-trellis over it, the trees being tied to the trellis, one side having Pears, the other Apples. A fruit of Warner's King growing on this trellis weighed 14 oz. *J. Currey, Milford Hill, Salisbury.*

BOCCONIA CORDATA.—Judging by recent communications to the columns of the *Gardeners' Chronicle*, it would appear there are some who have a doubt respecting the perfect hardiness of the above plant. This, however, is set at rest by the editorial footnote at p. 651, and if any further evidence were needed I may be allowed to state that with a twenty years' experience of it, in all sorts and conditions of soil, I do not remember a single death from frost or cold. It is one of the handsomest herbaceous plants that we possess, and which everyone may plant with perfect safety on any exposure. Given fair plants to begin with, it is but little trouble to the cultivator after, and where needed for standing alone on the lawn, &c., for which it is capitally adapted, a bed fully 6 feet across should be given it; and by planting roots about 18 inches apart, an effective group would be secured. It may interest some at least of your readers to know that it may be increased rapidly from root cuttings, indeed the main roots are thickly furnished with buds, and if these main roots are detached during winter, cut into lengths of an inch or so, and placed in slight warmth, plants may be secured by the end of April, ready, if they have been grown on freely, to plant in the open ground. The inclination of this plant to break freely from the root is not generally known, as they do not send forth stolons as freely as many things while attached to the parent plant; those, however, who transplant it periodically for trade purposes, are familiar enough with it. To me it appears as though the main growths by their very vigour keep these underground buds in subjection; and I arrive at my conclusions from the fact that, whenever I have had occasion to

remove it to another bed, young plants quickly and freely spring up in the old place, and it is hardly possible to get out all the roots as they descend so deeply, and are very brittle. *E. Jenkins.*

HUMMING-BIRD HAWK-MOTH.—For years I have found insect-life a pleasant study, and seeing that the daily occupation of a gardener brings him in contact with insects, some of which are enemies, and others friends, it ought to be part of his daily avocation to watch their habits, and so learn to discriminate between friends and foes. It does not need much argument to convince the gardener that he has constantly to be on the alert in case some of them steal a march on him, and so ruin his crops or his choicest plants. For years I had collected moths and other insects, but it was not until I found the caterpillar of the death's-head moth feeding on the Potato that the idea entered into my head of breeding them and insects in general. Boxes were filled with light soil and a covering of glass, and whenever a caterpillar of any kind was found on any plant it was carefully brought home, placed in its box, and fed till it changed into the perfect insect in the following month or year as the case might be. When we remember that half the lovely fruits which we enjoy in the garden are probably the result of a cross brought about by accidental insect fertilisation, small wonder if we give the subject a share of our attention. Apart from this, one is struck with the habits of many insects, and the more one learns, the less he thinks he knows. In this county we have a great variety of wild flowers, and consequently a large field for the entomologist. In fine autumns one may see a good number of the moth alluded to above, and at one of our cottagers' shows, a nurseryman staged some Phloxes which attracted the moth, and, notwithstanding its shyness, kept there all the afternoon, flying away, and returning again and again to its favourite flower. *J. Rust, Eridge Castle, Sussex.*

A BROKEN TRIO.—In Bushey Park, and not very far from the famous Chestnut avenue, for many years stood a trio of huge evergreen Oaks. The terrible hurricane of November 11 laid the centre one of three low, but at least it had spent its life fully, for the exposure of the roots revealed the fact that all were dead, and that for a long time the tree had stood erect rather by tolerance than from inherent strength. It was for its kind a giant, and the twins remaining are not less so, whilst one is perhaps the finest individual tree anywhere in the Home counties. I have passed through the park many times in summer when the other trees were in full leaf, and had failed to observe that these huge specimens were evergreen. It is when all deciduous trees are disleafed that the specially fine form and luxuriant foliage of the evergreen Oak shows with effect. The finest of the now standing pair has a noble rounded head, but it is worthy of remark, as showing the power of the sun to attract branches to itself, that fully two-thirds of the head are south of the stem. That defect is evident only when the tree is looked at from the east or west sides. The diameter of the head is just about 70 feet, and it is as lofty as broad. The stem is very clean, with a slight twist in it, and at 8 feet high breaks into a dozen huge limbs or branches. At 3 feet from the ground the stem is about 15 feet in circumference, and the root-area close to the ground is 27 feet. This tree seems to be in rude health, as the growth everywhere about it is full of robustness. How old these huge trees are it would be difficult to say, but very likely they date from Cardinal Wolsey's day. Is there any finer evergreen Oak in the kingdom than the one I have described? *A. D.*

THE MODERN REMEDIES FOR THE POTATO DISEASE.—It is now forty-six years since I first began to read the *Gardeners' Chronicle*, the year when the Potato disease became so general, though I and others had seen it (the disease) two or three years previously, and since which I do not think I have missed seeing the paper one week. What acres of rubbish have been written about the disease since then, and now we are as far off a cure or remedy as forty-six years since. The atmosphere is of too large a volume to treat with any antiseptic. *V. J. Z.* [We do not share our correspondent's opinion; high moulding and the proper use of sulphate of copper are remedial measures full of promise. Ed.]

A DIPTEROUS LARVA DESTRUCTIVE TO CARNATIONS.—A well-known horticultural firm has submitted to me young plants of Carnations and Picotees much damaged by a dipterous larva. In the

first consignment I could find no larva, and put the mischief down to the universal weevil (*Otiorynchus*). A second consignment showed unmistakably that the maggots are the larvae of a dipterous insect, probably of the family Anthomyiidae; if I breed the perfect fly, you shall have the precise identification. The larva feeds in the stem under the crown, and at the base of the leaves, often causing the crown to drop off from the stem, and thus practically destroying the plant. I could only suggest the radical cure of burning the affected plants, or the application of strong insecticides. According to the maggots, the perfect insects should be about the size of the common house-fly, and many of the Anthomyiidae so greatly resemble house-flies as to be commonly mistaken for such. *R. McLachlan, Lewisham, Dec. 11.*

ROCKERIES.—May I just say that I think admiration for Messrs. Backhouse's rockery is a matter of course? But that does not tell us how alpine plants can best be grown in this country. They have a fine collection of frames to rely on at York, and the resources of a splendid nursery at their command. These frames are very analogous to the method I follow. Mr. Corveon can scarcely, I think, have read my letter with much attention. He says "the 'H. E.' system (as he calls it) is not good for some species, and he (Corveon) prefers the little separate rock-pockets, and, above all, the wall-plan." Why, that is just what "H. E." says himself, and, accordingly, he leaves out the *not*. Surely, *Morisia hypogaea*, of Sardinia, which came from the Jardin d'Acclimatation at Geneva, is a drought-loving plant. Nothing could do better than it has done here. The same may be said of other things, which Mr. Corveon takes for granted as having failed. *H. E., Ryde.*

STANDS FOR JAPANESE CHRYSANTHEMUMS.—I quite agree with your correspondent, that a change in the size of the above is most desirable, as the beauty of the largest flowers, as at present shown, is greatly hidden by the unavoidable overcrowding, and judging is made more difficult than it would otherwise be if each flower was separated by more space from its neighbours. But to accomplish this latter point, I consider the size mentioned on p. 708 is still too small, as it only allows 7 inches from centre to centre of the flowers lengthways, and a trifle more in the other direction. If an alteration is made, by all means let us have enough space this time, as a change in this respect means a lot of expense in providing new stands and travelling boxes. I think the size should be 32 by 24 inches, which would give 8 inches from centre to centre; and even this would soon be too small, if we get many more varieties of the size of *Etoile de Lyon*. And, again, it should be optional with exhibitors, but not compulsory before 1893, or some of the small growers will object to it, and the exhibitors suffer in consequence. *W. H. Divers, Ketton Hall Gardens, Stamford.*

ORIENTAL PLANE.—As an avenue tree, the Oriental Plane is quite condemned in this country (Belgium). Those in the Boulevard Botanique, at Brussels, are being replaced by Elms, and I think wisely, too. It is not a well-behaved tree here by any means. It is liable to suffer from frost, and an early frost in autumn renders all the leaves on the ground so many "suckers," thereby dangerous to walk upon, and difficult to gather up, from their fleshy nature and persistent ignoring of the natural drying process that other leaves submit to. *K.*

CHRYSANTHEMUM ETOILE DE LYON.—Much of the grumbling occasioned by this variety is caused by the wrong methods adopted in its culture. If people will try and obtain such extra large—in breadth—blooms of it, they must put up with the coarse, irregular florets, and washed-out appearance which the flowers have. There is no variety which has been subjected to so much adverse criticism as *Etoile de Lyon*, and none which deserves less, for if it grows very coarse, it is the fault of the growers, who do not understand its requirements. It is a splendid bloom in three ways, and it is not every variety about which the same can be said. In the first place, if large blooms are desired, they can be had without a shadow of coarseness, with well-developed centres, and of a rosy-purple colour, which cannot be found in any other variety, but the buds must not be "taken" before August 20, or the blooms which are so adversely criticised will be the result. In the second place, there is no variety which makes a better bush than *Etoile de Lyon*; or as a trained specimen either it is useful. Early in the season I saw some splendid free-flowered ones of it not more than from 3 to 4 feet high, densely clothed with the kind of foliage which this variety is remarkable

for; and again, at York, I saw some finely-grown plants of it. In the third place, it is the best that we have in bloom on the wall out-of-doors now, December 12, and this, too, in spite of the heavy winds and the continued wet weather; for not a stem or a brick can be seen behind where this plant is growing for the dense mass of leaves. Under all these conditions of excellence, I would advise those who grumble so much at a variety which does not deserve it, to grow it better before rushing into print needlessly. *E. M.*

UNLUCKY GARDENERS?—At p. 709, Mr. W. Napper, Chelsea, says, "I quite expect that the "men of mark" mentioned by Mr. Burbidge, owe their distinction in a large measure to tact and patronage. For instance, there would have been no Sir Joseph Paxton had there not also have been a Duke of Devonshire; and my late lamented friend, John Dominy, would probably have gone down to his grave a poor obscure Devonshire gardener, instead of an Orchid specialist and hybridiser, but for the great house of Veitch." I totally disagree with the logic thus employed by Mr. Napper, holding that men of the *calibre* of Paxton and Dominy, are not lights to remain long hidden under a bushel, no matter how big the bushel may be! Paxton saw the structure of the hollow ribs of the Victoria leaf, and logically applied the principles of their construction to the iron girders of the great exhibition of 1851, now the Crystal Palace, Sydenham. The late Duke of Devonshire approved of his project, but Paxton's was the master mind, and his idea was all his own, and the only feasible one of its time for the purpose intended. Then, John Dominy was not instructed how to hybridise Orchids and Nephentes by his employers, but by Dr. Harris, of Exeter, a friendly amateur. The late Mr. Jas. Veitch found in Dominy a staunch and faithful ally, and if history speaks the truth, it will be said in the future how that James Veitch and John Dominy built up the great business in London hand in hand and side by side, more like brothers than master and man. Neither Paxton nor Dominy were men that could be "patronised," by which, I mean bolstered and coddled into success or popularity. Both were born gardeners, and born gentlemen; if the scriptures of Burns about gentlemen be true, then their's was, indeed, a noble heritage. I am very sorry that Mr. Napper thinks that "patronage" is necessary for a gardener's prosperity. A good gardener is not like a marionette—a thing to be worked by wires! I think the less patronage a man of any kind gets the better for the man, if he has common sense and grit in him; and, of course, if he has not these, patronage will only land him still deeper into the mire. Surely the days of patronage are doomed. Only the other day, I saw the nursery as a refuge for gardeners out of place styled "the poor house," by a Scotch gardener who was lamenting the practice of gale day in Scotland. Now what is "tact" if not common sense, i.e., a logical mind? Of course, if a man is illogical, he will suffer for it, and perhaps screen his own shortcomings under the unmeaning phrase "unlucky." Luck is a poor thing for anyone to trust to, and a bad peg on which to hang an argument. I yield to no one in sympathy and respect for "all sorts and conditions of men," who fail through no fault of their own; for example, if a gardener is stricken down by accident or by disease, or, as sometimes happens, is suddenly cast adrift with a large family by the death of his employer. There are cases that demand pity and real assistance ungrudgingly given, as I well know. Some of us think that, good as is the Institution now devoted to the relief of aged gardeners and their widows, something better could be devised—something of aid and help to all honest gardeners of all ages and at all times, providing they would subscribe when their employment was sure. What we really do want is a society that would take up the case of the gardener, enroll his name, guarantee his honesty and respectability, and when he may happen, through no fault of his own, to be unemployed, then provide for his immediate wants—i.e., supply food and shelter—and at the same time aid him to gain another situation. Some of us think, and say, that the Royal Horticultural Society of England has never done its real duty towards the gardeners of England, whatever it may have done for their employers. It is just now good in its action, as far as it goes, but it certainly does not go far enough, nor deep enough in its relations with the practical gardeners. It "patronises" the nurserymen, rather than seeks to elevate and strengthen the gardener! So long as good honest men are, as Mr. Napper states, left "to

haunt the London nurseries" for situations, or even for temporary employment at starvation wages, so long is the true mission of our Royal Horticultural Society undone! The building of a horticultural hall, and the publication of belated information in its journals, that but few ever read (as compared with those who read the gardening journals), is one way "how not to do" a great and wide-reaching and a glorious work. I shall have something to say on this subject ere long, but dare not now further trespass on your space. In conclusion, I should like to ask Mr. Napper if he has not known some gardeners who had no one but themselves to blame for being "unlucky?" I still say, that there is a scarcity of good all-round gardeners, especially so of good hardy plantsmen. *F. W. Burbidge.*

RENOVATING LARGE STANDARD FRUIT TREES.

THESE may often be seen bearing fruit far inferior to what is found on younger trees; such fruit, in fact, as is scarcely worth gathering and storing in a plentiful season. Many people seem to imagine that a standard Apple or Pear tree which has grown to its full size requires no more attention beyond picking the fruit, hence the trees gradually decline in vigour until they die from exhaustion and bad management long before their time. This is more often the case when the land beneath is sown down with grass. Sometimes these trees are sawn off and grafted with another variety, and again give good crops after the three or four years rest which they get; but many of them, if not too far gone, may be improved and restored to good health by a much quicker process.

They should be taken in hand if possible before the leaves fall, and the first operation is to thin out all useless wood from the top. Take out all small branches from the centre, for although these bear the largest and finest-looking leaves, the fruit from them is of no use, being small and flavourless from lack of sun and air. After clearing all this away, the outer branches should be thinned out, so that sun and air can reach all parts of the tree. By doing this while the leaf is on, the operator has a good guide as to the healthiest branches, and the densest parts of the head; but after the foliage is off, the branches spring upwards again, and the top is very different to what it is in the growing season. The weak branches also are not so easily found. If any wounds are made more than 2 inches in diameter, they should at once be covered with pitch, to prevent frost penetrating and causing decay. None of the outer branches on old trees require shortening unless there is danger of the trees overlapping each other. This should always be prevented by keeping a space of 3 feet clear around each tree, or the weakest growers will gradually be overpowered.

The roots will next require attention. If turf is growing under the trees, it should be broken up for a time, and the soil must next be taken off until the roots are reached. Do not interfere with these unless there is reason to suspect that they have got down into bad soil. If such is the case, and the trees are comparatively young, they should be undermined, and the thick roots which grow downwards shortened back, preserving all the fibres carefully, and filling in again with good soil, keeping the roots as near the surface as possible. The top must be firmly secured with cable-wire before the roots are cut, and only half should be done in one season, the other side being left for one or two years, in order that the tree may not be too severely checked. The whole of the space where the soil has been moved should be mulched over with some strawy manure as soon as finished.

If there is no occasion to disturb the roots, a good layer of manure should be put on as soon as they are found, and the whole of the soil returned on the top of this, laying it in a slight ridge all round the outer part, and covering the whole with some strawy litter, in order to keep out frost, and encourage root-action. If the succeeding summer is a dry one, the trees that have been thus operated upon should have a little assistance occasionally with water; or, better

still, some liquid manure, giving enough to thoroughly soak the whole mass of roots whenever it is applied.

A great improvement will be seen the first season after the trees are thus treated, and they will continue to improve for some time if well attended to. Any mulching that remains the succeeding autumn may be lightly forked in, and the following spring a good dressing of rich manure should be given as a mulching. This will assist the trees during another summer's growth, at the end of which the ground may be levelled over, if no more remains to be done, and grass may be sown again if required.

But prevention is always better than cure. Large trees often get exhausted through bearing an extra-heavy crop of fruit. Nothing is done to make amends for the great exhaustion of the soil, and it takes the trees several years to recoup themselves. Instead of this neglectful treatment, the roots should be supplied with plenty of sustenance during the time the crop is swelling. A liberal dressing of bone-meal, superphosphate, and nitrate of soda mixed together should be forked into the soil in order to supply in part the extra demand made upon the roots; this may be supplemented by liquid manure occasionally, and a mulching of good rich manure from the farm-yard. Thus treated, the tree will come out of the ordeal far better prepared for another year's crop, and the above measures may be supplemented in the autumn, if deemed necessary, by giving more farm-yard manure, and in the following spring with chemical manures. This is, of course, only possible in cultivated land; trees on grass can only be aided with liquid manure, while the grass remains permanent. *W. H. Divers.*

SCOTLAND.

DEVAHNA HOUSE, ABERDEEN.

THIS fine old house and gardens are the property and residence of W. Henderson, Esq., ex-Lord Provost of Aberdeen, and of world-wide maritime fame. Although it is situated almost in the town itself, yet once one is inside the gates, so effectually and skilfully has it been planted, that its park-like character completely masks the surrounding houses. The gardens have been well laid out, and equipped with several ranges of commodious glasshouses, which are well filled with a selected assortment of plants, many of which have, from time to time, appeared on the exhibition tables of the Royal Horticultural Society of Aberdeen and elsewhere, and with almost unvarying success; indeed, Mr. Proctor, the gardener, is the fortunate possessor of many cups and vases, all duly recording the fact of his successes at those exhibitions. Amongst the many things grown here, foliage plants and Orchids are perhaps the most prominent. Amongst the Orchids we noted a fine example of *Cypripedium Harrisianum*, carrying eleven flower-scapes, six of which were twin-flowered. *Cattleyas* are well represented, there being fine masses of *Mendellii*, *gigas*, *Sanderiana*, *superbiens*, *guttata*, *Dowiana*, a huge mass of *crispa*, and a grand piece of *Harrisonae*, and *Laelia Perrini*. *Dendrobiums* of the noble, *Wardianum*, and *densiflorum* types, were well represented, many of them having made fine growths, which will no doubt give a good account of themselves later. The useful winter-flowering *Laelia anceps* had thrown up many spikes, and was very vigorous. The same remark applies with equal force to *Cypripedium insigne* and *Odontoglossum crispum*. There were numerous examples of *O. vexillarium*, all growing away freely. There are many other plants equally noteworthy, but it will suffice to mention a few of the more prominent, as *Cypripedium Stonei*, *C. Roezlii*, *C. Godefroyae*, *C. Lawrenceianum*, *Angraecum Leonis*, a grand plant of *Peristeria elata*, *Miltonia spectabilis* var. *Morellianum*, *Oncidium Marshallianum* and *curtum*, *Masdevallia Veitchii*, *M. ignea*, *M. amabilis*, *M. Lindenii*, and *M. Harryana*, Bull's blood variety; and a useful batch of *Cologyne cristata*. In the stove we noticed some grand potsful of *Eucharis amazonica*, some of which Mr. Proctor told us recently had as many as thirty to forty scapes of

flowers. A couple of fine plants of *Adiantum farleyense* were conspicuous objects on the side-stages; and several specimens of *Cocos Weddelliana*. The roof was festooned with *Dipladenia Brearleyana*, *D. boliviensis*, and *Stephanotis*, &c. In the large conservatory there are some noble Palms and Tree Ferns. One *Dicksonia antarctica*, although only 6 feet high, girthed 12 feet at the base, and had a spread of about 20 feet, the deep green colour of the fronds demonstrating the health and vigour of the plant. Scarcely less noteworthy were fine examples of *Alsophila australis*, *Cyathea dealbata*, and in its way *Platynerium alaicorne*. There were several fine *Kentia australis*, *Corypha australis*, *Diplothemiums*, and *Chamaerops excelsa*.

The distinct *Araucaria Rulei* was represented by a fine specimen, also *Dasyliirion serratum*, a representative of a class of plants which, we think, might be more largely used, where rather hardy decorative foliage subjects are required; indeed a few degrees of frost does not seem to affect them—*Phormium variegatum*, *Imantophyllums*, *Camellias*, *Vallotas*, *Primula obconica*, and flowering tuberous *Begonias* are largely grown, and gave the necessary colour to render the whole arrangement effective. In the section of *Lobelias* of the *Erinus* type, many distinct forms have been obtained. But we do not remember having seen anything more distinct or meritorious than a variety which is grown here, under the name of *Royal Purple*. The flowers are very large, of a deep purple colour, with a clear and well-defined white eye. This and similar forms of *Lobelia Erinus* strikingly illustrates what may be done by exercising proper selection in habit and flowers.

Devalna House has, for at least a quarter of a century, been famed for its collections of plants, and under the present able management of Mr. Proctor, there is little fear of its prestige being lost or diminished. *F. R.*

OUT IN THE FRUIT NURSERIES.

ALTHOUGH the surroundings of Fulham and the close contiguity of the River Thames are unmistakable, yet once within the Southfields Nursery, where Messrs. James Veitch & Sons grow such myriads of fruit trees of all kinds, it is very easy to imagine that, after all, one may be in some country district where the air is pure, and London smoke and fogs are unknown elements, so wonderfully robust and healthy do all the denizens of this nursery enclosure seem to be. Whatever may be said as to the difficulties of tree culture in and about London, it is certain that here, in a low-lying, populous district, fruit trees, even of presumably the tenderest kinds, do wonderfully well—so well, in fact, that it seems almost impossible they could do better. Peach trees of all forms and sizes are so numerous, that it would seem as if all the wants of the kingdom for the ensuing winter could be more than satisfied, and yet every saleable tree will be sent out presently, and myriads of others, now maidens—and such maidens, too—will have to be prepared and trained ready for the next season's service. Peaches, Nectarines, and Apricots, in profuse variety, are formed from standards or riders, half-standards, or dwarf-trained trees, from 7 or 8 feet across, and admirably furnished. What profits some of these trees make, is found in the fact related to me by a wealthy man who purchased and planted many Peaches in new houses, and the very first season cropped and sold from them on the average 94 dozen of fruits each, at 16s. per dozen, the sample was so fine. That was a good investment in any case, and at that rate the produce will soon pay for the houses. Half-standards in 18-inch stems are favourite trees with many Peach growers, and these are found in great abundance. Standard trees and natural pyramids or bushes in pots for fruiting under glass are also plentiful, and very superior stuff. Cherries of every conceivable sort are also found at Southfields in great quantities. Especially so are Morellos in trained trees of all sizes, so that walls may be furnished instantaneously.

The constantly transplanted trees turn out masses of roots like mop-heads, to use a rough simile, and they may be safely moved at almost any age. What a wealth also is there of trained Apple and Pear trees. We see these in bush, pyramid, standard, half-standard, erect cordon, horizontal cordon, gridiron, or quintuple erect cordons, horizontal or espalier trees, fan-shaped, and even in various other forms, so ready is the management to fashion from Nature whatever the fancy of purchasers may require. Excepting a few quarters of Lilywhite Seakale grown at Southfields, just to give the soil a little change, we see there nothing but fruit trees in all stages of growth, the budded quarters just ready for the trees to be taken off, the maidens from last year's budding, and through various gradations up to well-matured trees four and five years old, specially retained to suit the demands of certain customers who want large trees, and do not mind cost. Not that after all the trees are dear; indeed, when we see what trouble has been expended in getting a wall tree into shape, and that it is well qualified to carry many good fruits the first year, the prices seem low. However, there is powerful competition just now in fruit tree production, and high prices do not pay. One curious product of the taste for odd things in fruit, is seen in some tall heads of Gooseberries worked on clean stems of a variety, the taller ranging from 4 to 6 feet high. Cordon and pyramid Gooseberries are also in great request.

In the case of Plums, differing from what is usually the case in other nurseries, every other or, perhaps, third plant in the quarters is run up into a standard, thus giving each class of trees ample head room. It need hardly be said that Plums, of which some seventy sorts are grown, are largely represented, for it is certain that one result of the present season's crop will be to create a big demand for trees presently.

Pears, as everywhere, fruited well, but it is a rule here not to allow trees for sale to crop heavily, as in such case the trees are somewhat distressed for the following year; just a few fruits are taken from each, that intending purchasers may note the samples produced, and these are invariably good. The same thing may be said of Apples also, of which there are many grand samples. Finely fruiting of Pears were *Burré Superfin*, *Madame Treve*, *Beurré Bachelier*, *Beurré d'Amanlis*, *Beurré d'Anjou*, *Doyenné Boussoch*, *Doyenné du Comice*, *Fondante de Cuerne*, and many others of great excellence.

Whilst Apples showed fine fruits in all directions, some fan-shaped trees, just to show what these can do in the production of fine fruits, have been left to crop more freely. What pictures would some Cellinis of this form of training make! It is very evident that a return to the old espalier and the fan-shaped tree in the choice sorts of Apples, we have seen, and on Paradise stocks, presents a method of culture well worthy the attention of those who would find home-grown fruits to compete with the American Apples in our markets; the method, beyond furnishing fine samples, also gives rich colour. Those who want colour specially, can hardly do better than grow plenty of trees of *Baumann's Red Reinette*; this variety, wherever seen about the nursery, glows in colour like to a Cockscomb, and, apart from its value as a fine keeping Apple, presents beautiful garden objects. *Bismarck*, too, colours finely, and so also do *Cellioi Pippin*, *Emperor Alexander*, *Gascoigne's Seedling*, *Landsberger Reinette*, *Salt-marsh's Queen*, *Sops in Wine*, &c. German Apples seem to give colour generally more than home-raised varieties of the later kinds, but in Mr. Gladstone, *Duchess Favourite*, *Worcester Pearmain*, *Lady Dudley*, *Jefferson*, *Red Quarrenden*, &c., we find plenty of colour. In earlier sorts of varieties less coloured, *Ecklinville Seedling*, *Stirling Castle*, *Winter Hawthornden*, the very best of all the Hawthorndens; *Robstone Pippin*, wonderfully fine on dwarf trees; *Bramley's Seedling*, *Sturmer Pippin*, *Peach Apple*, carrying a thick bloom; *Calville St. Sauveur*, not unlike *Dutch Codlin*, but is a good keeper; *Schoolmaster*, *Warner's King*, *Small's*

Admirable, *D'Eclat*, something after the style of *Bismarck*; *Betty Geeson*, *Crown Apple*, something after *Cellioi*, but keeps much longer; *Lord Suffield*, *Frogmore Prolific*, *Pott's Seedling*, *Lane's Prince Albert*, are but a few only of the many large-fruited sorts, giving samples of great excellence. Of smaller-fruited sorts, the good old and ever-ready cropping *Cockle Pippin*, *Wormsley Pippin*, *White Calville*, *Rosemary Russet*, *Franklin's Golden Pippin*, *Mannington's Pearmain*, *Small's Golden Pippin*, *Sturmer Pippin*, *King of the Pippins*, *Cox's Orange Pippin*, &c., are all good. Truly, it is difficult, if not impossible, to find any thing bad in fruits here, especially as in these days purchasers will have of the best only, so that it does not pay to grow inferior varieties.

FOREIGN CORRESPONDENCE.

ARISTOLOCHIA DUCHARTREI.

The gigantic *Aristolochia* recently flowered in *Kew Gardens*, and illustrated in the *Gardeners' Chronicle*, November 7, suggests to me to call your attention to another interesting species of this genus which flowers freely with us under the name of *Aristolochia Duchartrei*.

The flowers are pale rose, with markings of dark violet-purple, the blotch adorning the throat much more intense than the others. The aperture, which reminds one of some *Nepenthes*, is almost pure white, and the edges and interior of this tube are covered with woolly hairs, like those seen on the lip of *Dendrobium Dalhousieanum*, whilst all the remaining surface of the flower is shiny. The flowers vary considerably in size—we have had some measuring over 14 centimetres across, some 11 c. They are produced in clusters of three to five, on the oldest part of the stem, and they expand in succession.

The plants we flower are from cuttings struck last year, and planted out in an ordinary stove in June, since which time they have grown rapidly, climbing along a wire which runs close to the glass.

We may take this opportunity to mention a plant of *Aristolochia elegans* with numerous seed-pods, probably fertilised through insect agency. We think it advisable to grow *A. elegans* with more air than is usually afforded it, and have planted it out near the door of a temperate-house, which, during the summer, remains open the greater part of the day. It is in fine health, and has produced scores of flowers. *A. Lefebvre*, *Grüneburg*.

VEGETABLES.

WRIGHT'S GROVE PINK CELERY.

We have received from Mr. C. R. Clark, nurseryman, Retford, an excellent variety of Celery under the above name. It grows to about the height of *Major Clarke's Red*, but is much heavier than that favourite Celery. The sticks are stout, fleshy, solid, and sweet flavoured. The leaf growth is small. The samples sent had been planted on July 16, and in consequence of the short time that had elapsed, they were not fully blanched.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

DECEMBER 8.—Present: D. Morris, Esq., in the chair; and Mr. McLachlan, Dr. Michael, Dr. Müller, Rev. W. Wicks, Dr. Scott, Professor Oliver, Professor Rev. G. Henslow, Hon. Sec., and M. H. Vilmorin (visitor).

Prinula Forbesi, Franchet.—M. Vilmorin exhibited growing plants and cut blooms of this new species. It was discovered by Abbé D. Lavay in the province of Yunan, China, growing wild in marshes and Rice fields, where it is practically an annual.

The plants were raised from seed received from the Abbé, and under cultivation proved to be most perpetual bloomers. It much resembles *P. obconica* in the succession of flower stems, but otherwise is quite unlike it in appearance. The flower stems are very slender, and bear several (3 to 6) whorls of flowers, which, individually, resemble those of *P. farinosa*. It has produced but few seeds as yet, it possibly requiring a high temperature. It does, however, well in a cool house. The specimens appear to be all of the long-styled form, which may possibly account for the paucity of seed. The growing plants were presented by M. Vilmorin to Kew and to the Horticultural Society. A vote of thanks was given by the committee to M. Vilmorin for his very interesting communication.

Telephora sp. (?).—Dr. Muller exhibited what appeared to be some species of this genus growing round the stems of *Rhododendrons* in peaty sand. He thought it appeared to be parasitic. It was forwarded to Kew for further examination and report.

Fog and Rain.—Professor Oliver asked of M. Vilmorin if he had experienced in Paris any ill-effects of fog comparable to those familiar to growers of plants in the neighbourhood of London. He replied in the negative, as a typical yellow fog is unknown in Paris. He observed, that sometimes a well-marked local increase of rain was induced to fall, through condensation brought about by trees.

Narcissus bulbs attacked by Merodon.—Mr. G. Lee, of Clevedon, sent bulbs with this well-known pest. The only methods of destruction are either to cut out the portions containing the grubs, soaking the bulbs in water to drown them, or else by destroying the bulbs altogether.

Benthamia fraifera, fruit.—Mr. R. G. Lakes, of St. Austell, Cornwall, sent some fine ripe fruits of this species of tree.

Citrons.—Mr. P. Crowley, F.L.S., forwarded two fine fruits of *Citrus medica*, which were taken from trees growing at Waddon House, Croydon.

NORTHERN BOTANICAL AND HORTICULTURAL.

DECEMBER 9.—The annual meeting of the Botanical and Horticultural Society of Durham, Northumberland, and Newcastle-upon-Tyne, was held at the chambers of the Secretary, Mr. Jas. J. Gillespie, A.C.A., Cross House, Westgate Road, Newcastle, on the above date. In the absence of the Chairman, Mr. Benjamin Plummer presided.

In their report for 1891, which was submitted, the Council state:—In previous reports the Council have invariably had to attribute the failure of the year's operations entirely to the wet weather which had prevailed at the shows; in spite of which they have struggled from year to year to keep the Society together, notwithstanding that there has often been a large deficiency in the funds. This year the Society commenced free from debt; the spring show, held in April, was a financial success, and the Council looked forward with confidence to the autumn show, which was likely to have been one of the best ever held, exhibitors having brought their plants from an area extending as far south as Wiltshire, and as far north as Aberdeen. What happened is now a matter of history, as on the Council assembling in the early morning of August 26, at the Leazes Park, to place the exhibits, they found the tents had been almost destroyed by the gale of the previous night. The Council then decided to abandon the show. The Council again met on Thursday, August 27, and after considering the claims sent in, and the available funds of the society, it was found there was a deficiency of £335, and it was subsequently decided to appeal to the public for assistance. The response was generous, and far exceeded the expectations of the Council, with a result, as shown in the statement of accounts submitted, that not only were the liabilities of the society paid off, but there is a sum of £560 to the good. The shows have been fixed for next year as follow:—Spring show, April 27 and 28, in the Town Hall; and the autumn show, August 24, 25, and 26, in the Leazes Park.

In the course of his remarks on the past fortunes of the Society, he commended the notice of the Society an essay on profitable fruit-growing, which had gained the prize offered by the Fruiterers' Company of London. One paragraph in that essay dealt with the successful results which had followed the distribution of fruit trees among cottagers and

artisans. He asked if the Council of this Society could not do something without very much cost to follow this example. Speaking of the small attendance at their annual meetings, he suggested that, to induce increased attendances, they might arrange to hold these meetings in the afternoon, and have a paper read connected with some particular branch of their operations. If they could move in this direction, they would hold the public more with them. He had heard it frequently thrown out as a reproach to the Society that they did nothing but cater to amusement, or practically did very little towards the purposes for which the Society was formed.

Mr. Neabitt seconded the adoption of the report and accounts, and this was agreed to.

The re-election of Mr. Thomas Nelson, J.P., as President, and election of the Mayor of Newcastle (Councillor Wm. Sutton) as Vice-President, were then formally carried, and other officials were also appointed. *Extract from Newcastle Daily Leader, Thursday, December 10.*

EDINBURGH BOTANICAL.

DECEMBER 10.—The Society met at 5, St. Andrew Square, in the evening of this date, Dr. Cleghorn, Vice-President, in the chair.

A branch of *Posoqueria multiflora* in fine flower was exhibited from the Royal Botanic Garden.

Dr. William Craig read an account of the excursion of the Scottish Alpine Club to Tyndrum in 1891. One of the party, Mr. W. B. Boyd, of Faldonside, Melrose, found three good varieties of *Asplenium viride*, which in the event of their peculiarities being permanent, he proposes to name respectively *vars. bifidum, truncatum, and convolutum*. An interesting form of *Scirpus fluitans* found in deep water was exhibited. Dr. Craig gave an outline of the history of the Club since its foundation, twenty-one years ago. With three exceptions, viz., to Teesdale, Norway, and Connemara, the excursions had always been made to the highlands of Scotland.

Dr. A. P. Aitken read a paper on "Roots of Grasses," in relation to upper growth. Details were given of experiments with agricultural grasses, all grown for a year under similar conditions, in zinc boxes 2 feet deep and 6 inches square. The roots were then removed, cleaned, measured, and weighed. Striking results were obtained, showing the relative amount of root in the upper 8 inches of the soil, and that occupying the deeper 16 inches. *Lolium perenne*, grown from good seed, was the only grass with greater development of root below the 8 inch line than above it. *Cynosurus cristatus* had almost all its roots in the upper 8 inches. The practical importance of ascertaining the relative power of rooting above or below this limit was pointed out.

Notes on the Flora of the Moffat District for 1891, were sent by J. Thorburn Johnstone.

Report on Temperature, &c., at the Royal Botanic Garden, Edinburgh, by R. Lindsay, Curator.—The past month of November, although somewhat changeable and unsettled, has been mild. Storms of wind and rain were less frequent than usual, and no snow fell. The thermometer was at or below the freezing point on twelve mornings, indicating collectively 41° of frost for the month. The lowest readings were on the 18th, 28°; 23rd, 24°; 24th, 26°; 27th, 24°; 28th, 25°. The lowest day temperature was 38° on the 27th, and the highest, 55° on the 2nd. Rain fell on eleven days. Out-door vegetation is as nearly as possible in a resting condition. Not a single plant came into flower on the Rock Garden during the month.

Report on Temperature, &c., at the Botanic Garden, Glasgow, by R. Bullen, Curator.—This was another wet, variable, unseasonable month; much dark and foggy weather prevailed. The maximum and minimum readings of the thermometer were both high for the season. No frost was registered until the night of the 21st, but after that light night-frosts were frequent. The lowest reading was 7° during the night of the 23rd, and the total only 26°. Owing to the wet state of the ground, out-door work had to be abandoned.

VARIORUM.

A NICE NAME FOR A TALLY, SCHTSCHUROW-SKIA.—It applies to a genus of Umbelliferae, near *Coriandrum*.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts:—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts:—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending December 12, is furnished from the Meteorological Office:—

"The weather during the week was extremely unsettled and changeable, with frequent and heavy falls of rain, alternated, however, by fine, clear intervals. A good deal of snow fell over all our more northern and north-western districts towards the close of the week.

"The temperature was a little below the mean in the north and east of Scotland, but in all other districts it was again above, the excess over eastern, southern, and central England being as much as 6°. The highest of the maxima were recorded either on the 9th or 10th, and ranged from 56° in the south and east of England, the south of Ireland, and the Channel Islands to 50° in 'Scotland, N.' The lowest of the minima, which were registered during the earlier part of the week in Scotland, and towards its close elsewhere, varied from 19° in 'Scotland, N.,' and 21° in 'Scotland, E.,' to 20° or 30° in most other districts, and to 37° in the 'Channel Islands.'

"The rainfall exceeded the mean in all districts, the fall in most cases being nearly three times the normal.

"The bright sunshine was more prevalent than during the previous week in the wheat-producing districts as well as in 'Scotland, W.,' and the 'Channel Islands,' but shows a slight decrease elsewhere. The percentage of the possible duration ranged from 12 in 'Scotland, N.,' and from 13 to 17 in most of the western districts, to 27 in 'England, E., and N.E.,' and to 33 in the 'Channel Islands.'

MARKETS.

COVENT GARDEN, December 17.

No alteration in prices; business somewhat brisker. James Webber, Wholesale Apple Market.

Cucumbers, each	... 0 6-0 9
Endive, per dozen	... 2 0-3 0
Herbs, per bunch	... 0 9-1 0

POTATOES.

Arrivals continue heavy, but stocks have not increased to the extent that was expected, which may be accounted for by the fact of the usual increase in the demand about this time of the year. Prices have ruled fairly firm, the medium quality only having a tendency to fall. Best samples, 90s. to 100s.; medium, 60s. to 70s.; common, 55s. to 65s. J. B. Thomas.

SEEDS.

LONDON, Dec. 16.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report to-day's market thinly attended, with, as is usual, towards the close of the year, less business doing in Clover seeds. However, as regards values, a strong undertone is observable all round. American red, in particular, is extremely firm. Blue Peas, with for the moment a less excited demand, are held with great steadiness; existing stocks, it is now well established, are wholly inadequate for the requirements of the approaching winter. Haricots and Runner Beans realise full prices. Linseed is slow.

FRUITS AND VEGETABLES.

SPITALFIELDS: Dec. 15.—Quotations:—English Apples, 3s. to 6s. per bushel; American do., 10s. to 12s. per barrel; Pears, 1s. to 2s. 6d. per half-sieve; English Tomatoes, 4s. to 6s. per peck; foreign do., 1s. to 2s.; Seakale, 1s. to 1s. 6d. per punnet; Cabbages, 1s. 3d. to 2s. 6d.; Savoys, 1s. 6d. to 2s. 6d.; Cauliflowers, 6s. to 10s. per tally; Greens, 1s. to 1s. 9d.; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 1s. to 2s. 6d.; Parsley, 1s. 6d. to 2s. per dozen bunches; Spinach, 1s. 6d. to 1s. 9d. per bushel; Parsnips, 1s. 6d. to 2s. per score; Endive, 1s. to 1s. 6d.; Cabbage Lettuces, 6d. to 1s.; Beetroot, 3d. to 6d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Bordeaux Onions, 4s. to 4s. 6d.; Spanish do., 6s. to 7s. per cove; Belgian do., 3s. 6d. to 4s. 9d.; Dutch do., 3s. 9d. to 5s. per bag of 110 lb.; Celery, 6d. to 1s.; Horseradish, 1s. to 1s. 1d. per bundle.

STRATFORD: Dec. 15.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Savoys, 3s. to 5s. per tally; Greens, 1s. to 1s. 6d. per dozen bunches; Cauliflowers, 9d. to 1s. 3d. per dozen bunches; do., 3s. to 6s. per tally; Turnips, 1s. 6d. to 2s. 3d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 31s. to 45s. do.; do., cattle-feeding, 25s. to 32s. do.; Parsnips, 60s. to 70s. do.; Mangels, 14s. to 15s. do.; Swedes, 18s. to 25s. do.; Onions, English, 100s. to 120s. do.; do., Dutch, 3s. to 4s. per bag; Apples, English, 2s. to 6s. per bushel; American, 14s. to 20s. per barrel; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; do., 1s. 9d. to 2s. 6d. per sieve; Horseradish, 9d. to 1s. 6d. per bundle.

BOROUGH: Dec. 15.—Quotations:—Savoys, 2s. 6d. to 3s. 6d.; Broccoli, 5s. to 8s. per tally; Spinach, 1s. 6d. to 3s. per bushel;

Turnips, 1s. to 1s. 6d.; Carrots, 1s. to 1s. 9d. per dozen bunches; English Onions, 4s. 6d. to 5s. per cwt.; English Apples, 2s. to 6s.; Pears, 2s. 6d. to 7s. per bushel; Canadian Apples, 12s. to 15s. per barrel; Newtown Pippins, 16s. to 30s. do.

POTATOES.

SPITALFIELDS: Dec. 15.—Quotations:—Magnums, 57s. 6d. to 70s.; Regents, 60s. to 70s.; Champions, 55s. to 60s.; Imperators, 60s. to 75s.; Hebrons, 60s. to 75s.; Bruce Magnums, 60s. to 70s.; Snowdrops, 55s. to 75s. per ton.

BOROUGH: Dec. 15.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 85s.; Magnums, 60s. to 90s. per ton.

STRATFORD: Dec. 16.—Quotations:—Magnums, 60s. to 85s.; White Elephants, 65s. to 75s.; Hebrons, 65s. to 75s.; Scotch Magnums, 90s. to 100s. per ton.

CHRISTMAS CATTLE MARKET.

Notwithstanding the abnormal atmospheric conditions under which graziers have laboured during the past twelvemonths, but little indication of this was evident at Islington last week at the Great Christmas Cattle Market, when, though the numbers were less than on the previous occasion, the quality was of very high order, and fair average prices were obtained. As usual, the Scots were to the fore in largest numbers, and in prime condition; so also were the Devons and Herefords, &c. The market opened slowly until an idea of the demand was obtained, and a very fair trade resulted. The same remarks apply to sheep; here and there among the Downs some pens of rare excellence were to be found; but the principal characteristic is reported as a good all-round evenness, which met with a fair demand at average prices.

NOTICES TO CORRESPONDENTS.

ARALIA SIEBOLDI: F. R. From seeds, or cuttings of shoots in heat in the spring, or of the roots in the autumn and treating them cool.

ASPARAGUS IN THE FRENCH METHOD: A Constant Reader. The variety may be the common or the Argenteuil, it does not much matter which. Instead of growing it on raised beds as here, it is grown in broad, shallow trenches, about 9 to 10 inches deep, with broad alleys between. The soil is carefully scraped off the crowns in the autumn, and placed in the alleys; the bed is then heavily dressed with rotted manure, and just a little of the soil is thrown over it—sometimes. When the Asparagus starts, or, rather, just before it does so, some of the soil is returned to the bed from out of the alleys, adding more and more until it is all put back. The shoots having to grow through this thick stratum of mould become blanched, as you see it in our shops in spring and summer. When it is eaten quite fresh from the beds, a good portion of the top is eatable, but it soon toughens, till only the top can be eaten. However, it sells here, and the Frenchman pockets a large sum yearly from its sale. A great deal of this kind of "grass" is grown on sewage-farms near Paris.

ASPARAGUS ROOTS: T. C. The portions sent look like the outside crowns of larger clumps, or seedlings stunted by bad culture.

BOG-BED: T. L. C. The hole seems to have been excavated unnecessarily deep; 2 feet 6 inches would have been a better depth. In place of stagnant water, it would be better for the plants if you were to conduct a stream of water through the bog-bed. This stream should have a clayed bottom, over which water-worn pebbles might be laid, and by letting the peat soil about on this stream in places, sufficiently moist spots could be found for bog plants.

BOOKS: Clara, My Gardener, a Practical Handbook for the Million, and the Rosarian's Year Book, are published, the former by Messrs. Eyre & Spottiswoode, East Harding Street, E.C., and the latter by Messrs. Bemrose & Sons, 23, Old Bailey, and at Derby. We cannot tell you the price, that is a matter of business which the advertisers should attend to.—A Constant Reader. Handbook of Hardy Trees, Shrubs, and Herbaceous Plants, by Decaisne, Naudin, and Hemsley (Longmans, Green & Co.)—CONFEROUS PLANTS: The Manual of Conifera, by J. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea.

CELERY: A Constant Reader. The strain possibly is not a good one. In large quantities of plants there will always be a few that will have divided stems.

COMRULEA: J. C. G. As printed.

COMMON PEPPERMINT: A Constant Reader. The common Peppermint is certainly not an annual; it is a herbaceous perennial. It is extensively grown at Mitcham.

CORRECTION.—In our last issue, p. 706, My Gardener, for M. W. Ward read H. W. Ward.

EARLY POTATOS IN MALTA: H. B. P. The planting would need to be performed about ten or twelve weeks—according to the time of year—before they are required for market. We do not know the name of the varieties grown, but we do know that the quality is about as bad as could be, and that if we, in this country, put such poor ware on the market, there would be but a poor sale for it.

ECHINOCACTUS AND CACTUS: Old Reader. Pot the former almost on the surface of the soil, which should consist largely of burnt earth broken fine, sandy loam, and a small portion of leaf-mould; the drainage should occupy one-third of the pot. Echinocactus never require much water, and during the six months of autumn and winter none at all. Some will do well in an intermediate-house, some in the stove, and a few may be grown in the greenhouse. Cactuses like a somewhat similar soil, but rather richer in humus; they will even be benefited by occasionally getting manure-water whilst growing—let them have at that time full exposure to the sun. Afford no water from October to March, and keep them at the warmer part of the greenhouse.

FLORIST: H. H. By all means let your son go to some suitable establishment in Germany, Belgium, or France for two or three years before settling at home.

GREVILLEA ROBUSTA: L. T. From seeds generally.

"HORTICULTURAL TRANSACTIONS": R. D. We do not know. Ask some bookseller or advertise them.

NAMES OF FRUITS: Houston. Passe Colmar.—J. W. 1, Bergamote d'Esperen; 2, Winter Nelis; 3, Doyenné du Comice; 4, Vicar of Winkfield; 6, King of the Pippins.—Bourne & Son, 1, Dumelow's Seedling; 2, not known.—E. Gilman, 1, Stirling Castle; 2, Tibbett's Pearmain.—E. W. Piper, 1, a pale coloured Tom Pudding; 2, Wyken Pippin; 2, pear decayed.—Old Subscriber, 1, Pear Chamontelle; 2, Apple Dutch Mignonette.—H. L. E. The large russet fruit-streaked red is Tibbett's Pearmain; the other probably Dutch Codlin.

NAMES OF PLANTS: Hordeum. 1, Setaria italica; 2, Cynosurus cristatus; 3, Thamnorchortna argenteus; 4, Avena flavescens.—Peter A. Abies or Picea pinsapo.—J. H. J. Calceolaria.—H. L. E. Ferns, small-leaved, one is Adiantum æmulum; the other, A. capillus-veneris Mariæsi.—P. W. C. The tree is Ginkgo biloba, the Maiden-hair tree. The Lichen is an imperfect form of a Cetraria.—P. W. C., Horton. Erica hyemalis, E. gracilis, red. J. M. Next week.—D. J. Crassula lactea.—J. W. K. Maxillaria punctata—a small form of it.—J. W. W. Cymbidium giganteum, Cypripedium venustum, and a very good Odontoglossum Rossii majus.—L. L. Specimen received. Will refer to it next week.—C. W. 1, Cattleya Harrisonia; 2, Hydrangea hortensia medio-variegata; 3, H. hortensia variegata.—J. M. Nidularium Scheremetiewii, Regel.

PANCRATIUM LEAVES: J. T. L. The leaves are affected with a minute fungus, which often occurs when the bulbs are attacked with the bulb-mite.

STACHYS TUBERIFERA: D. H. Clean and scrape the tubers, and cook in water with a little salt, as you would French Beans; or eat them raw, like Radishes.

TREES ON THE THAMES EMBANKMENT: Tomsonii. Plantanus orientalis, var. acerifolia chiefly, Common Plane and London Plane.

COMMUNICATIONS RECEIVED.—Samuel Ray (next week).—Americus, E. M.—R. D.—A. W. C.—G. J. I.—U. Donat.—G. H. K.—H. W.—A. G. C.—W. W.—G. M.—W. A. C.—J. D.—T. S., Timaru, N.Z.—W. L.—E. M.—J. B.—R. W.—P. L. S.—Pteris.—R. D.—J. B. W.—J. U.—H. E.—W. A. C.—J. A.—P. W. (under consideration).

DIED.—We regret to have to announce the death on December 1, of Mr. JOHN WILLIAM VERT, at the age of 77 years, who, for over 52 years was Gardener and Bailiff to the Hon. Arthur and Mrs. Lascelles, of Noley House, Frodsham, Cheshire.

HUGHES' (SOLUBLE) INSECTICIDE
FIR TREE OIL

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

Sold by Seedsmen & Chemists, 1 1/2, 2 1/2, 8 1/2, 1 1/2-gallon 7 1/2, 1-gallon 12 1/2, or less in larger quantities.
A Treatise on FIR-TREE OIL as an insecticide, its application to Plants and Animals, sent post free on application to the manufacturer, addressed to
E. GRIFFITHS HUGHES, Victoria-st., Manchester.
Wholesale from all the London Seed Merchants and Patent Medicine Houses.
NEW YORK—A. ROLKER & SONS.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.
15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 8s. per gallon.

Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from
WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.

CHRYSANTHEMUMS,
And How to Grow Them. By C. E. SHEA, Esq.
A Practical and Scientific Treatise, that will be of great service, both to the oldest and most successful exhibitor and the youngest grower of the Autumn Queen. Mr. Shea has, by the treatment explained in his treatise, had a long series of triumphs, to which this season he has added, in keen competition with our most noted growers, at the Kent County, Watford, and Crystal Palace, finishing with the difficult feat of 1st in the 4s Japanese, at the Royal Aquarium Show, Nov. 10.
In addition to the above, a paper by Mr. H. Shoemith is included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world.
This valuable work is now ready, post free, seven stamps.
H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham.

MR. A. PORTOUS, as Head Gardener to E. H. WATTS, Esq., Devonhurst, Chiswick.
MR. CARPENTER, as Head Gardener to Mrs. DEWHURST, Highfield, Eastbourne.
Both of the above have been filled by Messrs. J. Laing & Son Forest Hill.

PARTNER WANTED, in an established NURSERY and FLORIST'S BUSINESS, in large south of England town, an industrious competent Fruit, Plant, and Cut Flower grower, with good references, to take charge of Nursery department. Nursery on out-kirts, and Conservatory in town. Both on lease. Capital required, from £600 to £750. — PARTNER, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, by the Corporation of Stockton-on-Tees, a thoroughly PRACTICAL GARDENER, to Superintend the Laying-out of the New Park, 40 acres in extent. He must have a good knowledge of Trees and Shrubs, and experience in their Planting; and possess an efficient method in the Management of Men. The person appointed would also be required to act as Curator and principal Care-taker of the Park. Salary £100, with House, Gas, Rates, and Water Free. Applications, with three recent testimonials, to be sent to me by the 21st inst.
MAT. R. DODDS, Town Clerk, Stockton-on-Tees.

WANTED, a HEAD WORKING GARDENER, near St. Albans.—Must be well qualified. Wages, 25s. and cottage.—Address, by letter, O. K., J. W. Vickers, 5, Nicholas Lane, E.C.

WANTED, thoroughly experienced SINGLE-HANDED GARDENER; must be a good all-round man.—Reply, stating age, experience, length of character, and wages required, to 4, Morden Road, Blackheath.

WANTED, a practical, energetic MAN, as GARDENER, to grow Flowers, Fruit, and Vegetables for sale and consumption. Must understand his business thoroughly, and be able to give satisfactory references.—Reply, stating age, salary, and copy of last testimonial, to R. H. MURPHY, Lowville, Merriam, co. Dublin.

WANTED IMMEDIATELY, a good SINGLE-HANDED GARDENER.—Must thoroughly understand all its branches, Inside and Outside. Wages, 20s. a-week. Age from 30 to 35. Good character essential.—H. G. HYSWELL, Emberton Manor, Newport Pagnell, Bucks.

Rose Grower.

WANTED, a young MAN, well-up in Propagating and Growing Roses, chiefly Teas, Indoors. Must have had previous experience in Grafting, &c. Permanent position, with progressive salary, to suitable man.—State wages and experience to H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton.

WANTED, a thoroughly good SECOND GARDENER. Married. Must thoroughly understand the culture of Gardenias, principally under glass. Good references required.—Also a SINGLE MAN, as thoroughly good CARNATION GROWER.—Apply, stating wages required in both instances, to GARDENER, Loudwater House, Rickmansworth, Herts.

WANTED, January 12, a young MAN, as SECOND, where three are kept, Inside and Out. Abstainer preferred. State age, experience, wages, &c.—HEAD GARDENER, Kirby Frith Hall, Leicester.

WANTED, a young man, as SECOND, in the Houses.—Well up in Fruit and Plant-growing. Abstainer. 17s. per week, bothy, vegetables, and milk. State particulars.—T. ROBINSON, Elsheld Gardens, Hollingbourne, Kent.

WANTED, WORKING FOREMAN.—Must thoroughly understand the growing Cucumbers and Tomatos for Market. Abstainer preferred.—Apply, HUMMERSTONE AND PIDINGTON, Colney Grove Nursery, Durant's Estate, Ponder's End.

WANTED, an experienced WORKING FOREMAN, to Grow Fruit and Cut Flowers for Market. It is requested that only those who can give satisfactory references will apply to S. W., Mr. H. Rides, Centre Avenue, Caveat Garden.

General Nursery and Seed.

REQUIRED IMMEDIATELY, in a very old-established Business, twenty-five miles from London, a thorough competent SHOPMAN, well up in all branches. Must furnish first-class references as to ability, honesty, and sobriety. Age about 30, preferred.—Application, by letter in first instance, to R. Q., 41, Wellington Street, Strand, W.C.

NURSERY & SEED TRADE.—A VACANCY will shortly occur in a leading firm for a representative of good experience, who must be reliable in every way, active, pleasant manner, pushing, and able to hold his own on the road. A good salary will be paid to a high-class man if found suitable.—Apply, in own handwriting, stating age, experience, and where acquired, references, and salary expected, to A. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Traveller.

WANTED, a thoroughly competent TRAVELLER, who has taken North of England and Scotland in Seed or Nursery Trade. Good salary to first-class man.—Apply, RICHARD SANKEY and SON, Bulwell Potteries, Nottingham.

WANTED, a JUNIOR ASSISTANT, for the General Seed and Bulb Trade. Good writer, accurate, active, and of good address.—Apply, with references and wages required, to R. P. KER and SONS, Basnett Street, Liverpool.

WANTED, a respectable well-educated YOUTH, as INDOOR APPRENTICE to the Nursery, Flower, and Seed Business. Premium required. Comfortable home.—COOPER and SON, The Nurseries, Hadleigh, near Ipswich.

WANTED, an IMPROVER for the Garden, to Help Inside and Out. Must have had a little experience in the Houses.—Apply, stating wages required, to W. POTTLE, Barrells Park, Henley-in-Arden.

WANTED, a young MAN, for Shop.—Must be good hand at making-up Flowers and understanding Seeds and Plants.—Apply, FLORIST, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Farm-Bailiffs, Foresters, &c.

TO MARKET GROWERS.—FOREMAN, experienced in Fruit, Tomatos, Cucumbers, Palms, Ferns, Cut Flowers, Grafting Tea Roses, Clematis, &c. Could manage branch business.—ALPHA, 1 Grove Road, Mitcham.

SHOPMAN, or MANAGER.—Sixteen years' experience in the London Seed Trade. Highest references as to character and ability.—HONESTY, 1, Little College Street, Westminster, S.W.

SHOPMAN.—Age 37, married; thoroughly experienced. First-class hand at Wreaths, Crosses, Bouquets, &c. Seven years' character.—W. S., 95, Lingfield Road, East Grinstead, Sussex.

SHOPMAN, or MANAGER.—Age 32; thorough knowledge of Seed, Bulb, Plant, and Flower Trade. Good references. State particulars.—W. HARRIS, Hammerwood, East Grinstead, Sussex.

SHOPMAN (ASSISTANT).—Nine years' experience; first-class reference. Could manage a branch. Abstainer.—EDWARDS, 275, Stamford Street, Ashton-under-Lyne.

HOLLOWAY'S PILLS.—Weak Stomach.—The wisest cannot enumerate one quarter of the distressing symptoms arising from imperfect or disordered digestion, all of which can be relieved by these admirable Pills. They remove cankerous taste from the mouth, flatulency, and constipation. Holloway's Pills rouse the stomach, liver, and every other organ, thereby bringing digestion to that healthy tone which fully enables it to convert all we eat and drink to the nourishment of our bodies. Hence these Pills are the surest strengtheners and the safest restoratives in nervousness, wasting, and chronic debility. Holloway's Pills are infallible remedies for impaired appetite, eructations, and a multitude of other disagreeable symptoms which render the lives of thousands miserable indeed. These Pills are approved by all classes.

TO THE TRADE.

FLOWER SEED NOVELTIES for 1892,

RAISED BY HURST & SON.

CHRYSANTHEMUM—NEW DOUBLE ANNUAL HYBRID VARIETIES.

This valuable and most unique Novelty has resulted from carefully hybridising and selecting for several years the semi-double varieties of this useful Annual, until a high degree of doubleness has been attained. They are extremely variable, but we have succeeded in fairly fixing five distinct colours as named below, and which we now offer separately and also in Collections of the five sorts, as well as in mixture as last year, the latter embracing a great variety of tints ranging from white and yellow to richest purples and crimsons with intermediate shades of rose, lilac, &c.

The separate varieties are as follow:—

- GOLDEN BRONZE, golden-yellow ground, the petals tipped with bronzy-crimson, constant.
- LILACINA, delicate lilac-rose, centre shading to deeper lilac-rose.
- PURPLE PRINCE, rich crimson-purple, guard petals slightly lighter.
- PICOTEE EDGED, creamy-white ground, each petal beautifully tipped with red, very fine.
- CRIMSON QUEEN, rich crimson, guard petals often golden-yellow, very beautiful.

Each of the above 5 varieties, 1s. per packet, retail.

COLLECTIONS containing the 5 varieties separate, retail.

All colours mixed, 1s. per packet, retail.

PRICES TO THE TRADE ON APPLICATION.

Electros of this Block 3s. 6d.

POPPY—SNOWDRIFT.

(PAPAVER ALBA PLENA FIMBRIATA.)

This magnificent introduction among annual Poppies originated in the United States. The flowers are given with wonderful profusion, and are fine for cutting, particularly from sowings made in the autumn: and when a duplicate sowing is made in spring, can be cut from June to October. It grows from 2 to 3 feet in height, and for a bold glistening white mass, in the select herbaceous border or shrubbery, has no equal.

A better idea of the flowers may be given by comparison with the best forms of white Japanese Chrysanthemums, with its cut tissue-paper like formation.

One Shilling per Packet, Retail. Price to the Trade on application. Please note, we do not in any case supply Retail.

SEED WAREHOUSE, 152, HOUNDSDITCH, LONDON.

IMPORTANT SALE of ESTABLISHED and IMPORTED ORCHIDS, from a well-known Private Collector.

MESSESS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, Jan. 1, 1892, at half-past 12 o'Clock, about 60 or 70 lots of fine ESTABLISHED ORCHIDS, from a private collection, including a very grand *Cypripedium*, amongst them *Niobe*, *Grande*, *Leannum superbum*, *Cymbidium superbum*, *Subralia xantholeuca*, 35 bulbs; *Subralia virginalis*, and several large plants of *Coleogyne cristata*.

51 lots of DENDROBIUMS, CATTLEYS, ODONTOGLOSSUMS, and CYPRIPEDIUMS, from another private collection. 100 lots of ESTABLISHED ORCHIDS, another Property, including *Cypripedium Morganianum*, *Harrisianum superbum*, *Coleogyne cristata alba*, *Laelia elegans Bluntii*, *Odontoglossum elegans*, *Laelia alba*, and other valuable species; an importation of 500 *Dendrobium McCarthiae*, 500 *Vanda spathulata*, 500 *Vanilla Pflanzensap*, received direct for unreserved Sale.

On view morning of Sale, and Catalogues had.

Friday, January 8, 1892.

PRELIMINARY ANNOUNCEMENT.

LINDEN'S GRANDEST DISCOVERY: CATTLEYA REX, JAMES O'BRIEN.

THE MOST FAMOUS ORCHID EVER INTRODUCED.

J. LINDEN, the discoverer and first introducer of nearly all the best Cattleyas in cultivation, viz. CATTLEYA AUREA, AMETHYSTOGLASSA, GIGAS, ELBORADO, TRIANÆ, WARDQUIANA (LABIATA AUTUMNALIS), &c., confidently recommends—

CATTLEYA REX

as the
FINEST OF THE GENUS.

CATTLEYA REX FLOWERS in DECEMBER and JANUARY.

Some amateurs have stated CATTLEYA REX to be a grand form of *Cattleya aurea*, with white sepals and petals, but it is a QUITE NEW TYPE.

CATTLEYA REX is described by JAMES O'BRIEN in the *Gardeners' Chronicle*, December 13, 1890.

Sepals and petals are creamy-white. The labellum is of the richest crim-on, of various shades—from the rosy hue to the purple tint—veined in a beautiful manner with golden-yellow, all worked in to form a richly colouring marbling. "It is a *Wondrous Piece of Colouring*."

Mr. R. JOHNSON, Sturt Hall Gardens, Whitefield, Manchester, writes to Messrs. LINDEN:—

"The CATTLEYA REX has flowered with us, and a grand thing it is. We have had some of the principal importers of Orchids here to see it; they think your plate in *Lindena* (English edition, Part I., 1891) a true representation of the flower, but the lip of our flower is finer than your Plate."

MESSESS. PROTHEROE AND MORRIS are favoured with instructions from Messrs. LINDEN, L'Horticulture Internationale, Brussels, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, January 8, 1892, at half-past 12 o'Clock, the whole of the above importation, just to hand in capital condition.

The plants have been collected by Messrs. Linden's intrepid collector, M. C. Elmer, with the greatest difficulties, who has searched with hundreds of natives for two years after this grandest Cattleya, and only succeeded in discovering those offered.

He states that "it is impossible to find any more."

A portrait made from a plant flowered in Monsieur Warocque's collection will be on view on the day of Sale.

On view morning of Sale, and Catalogues had.

WANTED TO RENT, near a good Town, 500 to 1000 feet run of good GLASS, and about 2 acres of LAND. Particulars to J. R. 3, Wandle Street, Hull.

Toothing.

TO BE LET, about 12 Acres of MARKET-GARDEN GROUND, in good condition. Near two Stations. Rent, £70 per annum. Crops and Tenant-right at a valuation.

Particulars of PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

TO BE LET, 14 miles from London, on the Bath Road, HEATHROW FARM, Harmondsworth, Middlesex, near Mielmas next; contains 178 acres of good Arable and 44 of Meadow Land. Let as a whole, or divided into three or four Market Gardens. The House and Buildings are 2 miles from West Drayton and Hayes Stations (G. W. R.), also Feltham and Ashford Stations (S. W. R.). No Agents need apply.

For particulars, apply to WALTER C. RICHMOND, Wrotham Park Estate Office, Barnet, Herts.

ARTHUR L. BULLEN,
WHOLESALE FLOWER SELLER AND GROWER,
33, EXETER STREET, COVENT GARDEN,
Stands, Nos. 271 and 272, Flower Market, Covent Garden,
and Highfield Nursery, Bromley Common, Kent.

Having been established nearly twenty years in Covent Garden Market, A. L. B. has a daily demand for Choice Flowers, and giving personal attention to all consignments, he is thus enabled to command full market prices for same.

each.

GARLIES MITCHELL, Nurseryman, Stranraer.

PALM SEEDS. SEASON 1892.

I have much pleasure in offering the following Palm Seeds, a large proportion of which are guaranteed to germinate.

- KENTIA BELMOREANA (Lord Howe Island) ... 20s. per 1000.
FOSTERIANA 20s.
CANTERBURYANA 40s.
MOOREII 40s.
ARECA BAUERII (Norfolk Island) 10s.
CORYPHA AUSTRALIS (New South Wales) .. 6s.
SEAFORTHIA ELEGANS 6s.
PTYCHOSPERMA ALEXANDRE (Queensland), 20s.

As these seeds ripen at different times, and all require immediate despatch, orders should reach here—for Kentias and Areca, in February; Seaforthia, in April; Corypha, in August; and Ptycho-perma, in November.

All Orders accompanied by remittances in full, for not less than £10 worth in one shipment, will be delivered free at Marseilles, Antwerp, Bremen, or London. Consults Fees to be added to American Orders for free delivery at San Francisco.

Also SEEDS and PLANTS of all our NATIVE TREES and SHRUBS.

F. J. FERGUSON, NURSERYMAN, DOUBLE BAY, SYDNEY, N.S.W.

NOVELTIES FOR 1892. THE BEST OF THE SEASON.

PANSY "PEACOCK" (NEW).

Rich velvety purplish-crimson, flushed with blue, shaded towards edges with light purple, and narrowly margined with white; white eye, with small yellow spot on bottom of petal, very pretty and effective. Per packet, 1s. 6d.

POPPY "MONT BLANC" (NEW).

A pure white double variety, very effective, either for grouping or for planting singly in borders. It is also very serviceable as a cut flower for vases. The plant grows about 2 feet high. Per packet, 1s.

PEA, WILLIAMS' HOLLOWAY VICTORY (NEW).

This splendid New Pea may be used either for main crop or as a late variety. It is 6 feet high, a strong grower, with very broad green pods closely filled with Peas, 7 to 8 in a pod. Per packet, 2s. 6d.

EARLEY'S HARDY CURLED SPROUT (NEW).

This new variety was raised by Mr. William Earley, the well-known horticulturist of Ilford, from whom we have secured the entire stock of this valuable vegetable, and who described it as follows: "A cross between Brussels Sprouts and Kale, Scotch Curled. The latter was crossed with Brussels Sprout pollen. This has produced a robust variety with true Brussels Sprout habit, the foliage being midway between the two parents; the sprouts also partake of the curled habit of the seed-bearing parent. It is extremely hardy, carrying its robust green foliage until late spring, and is destined to fill up the gap (after a large one) between late Brussels Sprouts and early Summer Cabbage. Being devoid of the roughness of Scotch Kale when cooked, and entirely free from the strong taste of Brussels Sprouts, its flavour is peculiarly original and pleasing. The thick-stalked dense crowns add very materially to its merits." Seeds now offered were grown direct from the plants produced by the cross-fertilised pod. Per packet, 1s. 6d.

NEW ORNAMENTAL-LEAVED BEET.

(McGregor's Favourite). Awarded First-class Certificate by the Royal Horticultural Society. This attractive and beautiful variety of Beet is quite a distinct and new departure, and will prove a great acquisition in the Flower Garden. Per packet, 1s.

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 26, 1891.

HAMPTON COURT, HEREFORD-SHIRE.

IN *Mansions and Manors of Herefordshire*, the author, Mr. Robinson, pronounces Hampton Court, Leominster, to be the first of the residences of Herefordshire in interest and beauty. I have always held, according to an old adage, that "comparisons are odious." Hampton Court is indeed lovely in its valley on the banks of the Lugg, with its beautiful lawns and gardens, its superb timber trees, giants growing in a rich soil, with parks around and woods enveloping the whole, like the walk which Milton describes as surrounding Paradise, so that his Satanic majesty, arriving from the nether regions, was almost baffled by it. Notwithstanding the beauties of Hampton Court, which stood confessed as I entered its precincts, I cannot forget Shobdon Court, or Bryngwyn. It is not the duty of a writer who makes sketches like the present to institute comparisons, but he ought to discriminate, and it must, therefore, be stated that Shobdon Court, the residence of Lord Bateman, stands higher and commands a wider landscape. The timber can hardly be excelled. The house is an excellent example of the Queen Anne style, not easily surpassed for comfort and handsome architecture; and the absence of running water might, with some persons, prove a recommendation. Bryngwyn is a modern house, which was built by the father of the present owner, Mr. Rankin, M.P., but it stands on an old site, is a first-class early English house, on high ground, with the Welsh hills in the distant prospect; and, in the foreground, a park enclosing a lawn of many acres, with the ruins of Old Bryngwyn, and as much timber, young and old, and as many handsome Conifers and groups of ornamental shrubs as heart could desire. Some persons prefer an unlevel surface immediately around a house, and a lawn sweeping downwards towards its further limits, and in that case they would find their ideal in Bryngwyn. Having now shown that the diversities of taste must always render comparisons dangerous, I may state that Hampton Court was sold in 1510 to that progenitor of an illustrious family, Sir Humphrey Coningsby, whose descendant, in 1808, sold it to the grandfather of Mr. J. H. Arkwright, the present owner. The house has been greatly altered from time to time; it is now a considerable pile, with an entrance gateway in a massive tower leading into a quadrangle, around which the house is built.

The surroundings of the house are charming; the Lugg, where millions of trout and grayling

are bred by the owner, flows in a winding channel through the park, and near the house, and its steep and wooded banks close the view. Within these limits, the sylvan beauty and seclusion of Hampton Court can hardly be surpassed. The soil is rich, and the timber superb. All the Engl's trees thrive here, and attain the largest proportions common to their kind. There are Oaks, Sweet Chestnuts, and Beeches in the park and grounds, quite first-rate in height and size, and there are many specimens of Planes which it would be hard to match for size and beauty. When those on the Thames Embankment have attained the same stately proportions, that noble boulevard will have become one of the twenty or thirty wonders of the world, as the 30-mile avenue of *Cryptomeria japonica* in Japan, is already. Three great English Elms, companion trees on the lawn, on the west side of Hampton Court, measure 18 feet and 20 feet girth, at 5 feet from the ground, with tall trunks and lofty heads. Cedars of Lebanon are scattered about in profusion, and like the other giants of forest or park, they have grown in this rich little vale of the Lugg to uncommon sizes. Two of the handsomest of the giant Cedars stand like guards on the south front of the house, one at each end, and noble fellows they are, being among the stoutest and tallest of their race, and wearing handsome clothing without a flaw, and richly set with cones. Among the prime ornaments of the several acres of level lawn on the south side of the house, are Cedars of Lebanon, Copper Beeches, and the *Taxodium sempervirens*. The *Cryptomeria japonica* is green and healthy here at all seasons. The Yew is another conspicuous tree, and when it grows in unrestrained beauty, feathered to the ground and rich in branch and foliage, few trees are more ornamental, none more enduring. A row of large Irish Yews, in one part of this extensive lawn, is deprived of its funereal aspect by a thick and lofty belting of the common Laurel in the background, and by other things which relieve the formal outlines of these dark-leaved shrubs. One lingers long on such a lawn, and before quitting it I should like to mention one of the prettiest pictures devised in one part of it by a skilful hand. Taking a great Cedar of Lebanon as a background, clumps of Ivy have been heaped over rockwork, or some other structure, now completely covered. In front of this green and broken wall, some flower borders enclose a fountain. In familiar language, this is a charming bit, and within the sunk fence which divides the park from the lawn there are many other charming "bits." And so there are on the high slopes of the deer park, across the Lugg, where deer and a little herd of long-haired white goats roam at will amidst ancient timber, forming a picture worthy of a forest scene in *As You Like It*. In walking further afield, one falls in with the homestead of the Home Farm and its large orchard, where Hereford cider is produced, and although the cider of the country cannot always be commended, the orchards and rich pastures on the banks of the Herefordshire streams are always charming.

I cannot refrain from noticing Mr. Arkwright's cattle. In fact, his beautiful Herefords grazing in the pasture fields, a herd here and a herd there beneath the trees, are among the characteristic ornaments of Hampton Court, whose owner is one of the most distinguished of the breeders of Hereford cattle. His famous poultry yards are another of Mr. Arkwright's amusements, and as an ex-M.F.H., his reminiscences are, no doubt, of a very interesting character. With his many occupations, and living in an

atmosphere fragrant with the odour of good deeds, his country life must be a happy one.

I had forgotten the Roses. They are propagated in a compartment between the lawn and the kitchen garden, and even the woodland paths are made bright with them. The houses show skilful management, the collection of tropical plants including several Ferns and other specimens, which are not of every-day occurrence—and all are propagated at home in a frame in the stove fitted with extra pipes. In walking round the fruit garden, I observed that the espalier Apples and Pears, then ripening their fruit, had their summer shoots partly cut through and bent down as the fruit began to swell. This, Mr. Arkwright thinks, assists in ripening the fruit, and improves its flavour. *H. E.*

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM × IMSCHOOTIANUM, *hyb. nov.*

This is a very interesting *Odonoglossum* which appeared in the collection of M. A. Van Im Schoot, of Mont St. Amand, Gand, Belgium, in May, 1889, and which is so precisely intermediate between *O. Lindleyanum* and *O. tripudians*, that there can be little doubt of its being a natural hybrid between them. The segments are remarkably like those of the first-named, except that the markings are a little more purple, and the same may be said of the lip, except that it is broader, and the crest and markings approach more closely to those of *O. tripudians*. The column is also much like that of *O. Lindleyanum*. These two species grow together, and the appearance of a natural hybrid between them is just what might be expected, considering the freedom with which *Odonoglossums* hybridise together in a wild state. I have not, however, found any evidence of the earlier appearance of this particular cross, unless it be one which appeared with the Liverpool Horticultural Company at about the same time. That, too, bears strong evidence of *O. tripudians* in the lip, but the colour of the segments is much darker, though in shape they are very similar. Further materials will probably throw some additional light on this point. *R. A. Rolfe, Herbarium, Kew.*

BIRDS OF THE COMMONS AND WOODLANDS.

(Continued from p. 731.)

THE GRASSHOPPER WARBLER.

If you go for a walk on some heath early on a bright morning in May, you may hear a sound resembling the running out of a fisherman's reel. This sound will at one moment appear to proceed from some object close at hand, and the next moment sound as though it came from a distance. The owner of the voice, which will become silent directly you make the slightest noise, is the grasshopper warbler, a small greenish bird, which arrives in this country in April and stays with us till September. It is a distinctly shy bird, and not a very easy one to observe, partly on that account, and partly on account of its being such an accomplished ventriloquist that it is often very hard to know where to look for it. If you want to observe it closely, you must keep still for some time without making the slightest sound, when it will perhaps walk out from under some shrub close in front of you.

CHARACTERS OF BIRDS.

A good naturalist soon learns the characters of birds, and he uses this knowledge when making his observations. A very short acquaintance with the grasshopper warbler will teach you that it is very shy; the nightingale is passionate; the whitethroat

fussy and demonstrative; the goldcrest the essence of contentment, and so on. They each have their marked dispositions. The best way to make the sedge warbler show himself off, is to throw something at him; he is of a noisy excitable disposition, and will instantly commence to chatter, scold, and swear at you. But with its near relative, the reed warbler, it would be fatal to assume the offensive; throw a stone at a reed warbler, and you will simply frighten it out of its wits.

THE WHEATEAR, WHINCHAT, AND STONECHAT.

One of the first arrivals in England in spring is the wheatear. This handsome bird may frequently be seen on commons and places where there are waste lands, especially if bounded by stone walls, and it is also frequently seen on chalk downs and mountain sides. You cannot help noticing it on account of the white tail, which is very conspicuous in flight, and from which it derives its name: "wheat" being merely a corruption of "white," and "ear" being an Anglo-Saxon word, and having nothing to do with our word "ear." In districts where there are stone dykes, you see them perched on the top, always flying a few yards further away when you get within a certain distance. The stonechat and whinchat are also both birds of the commons, and are often mistaken for one another, although they differ in many respects. Both have reddish breasts and brown backs, but whereas the head of the stonechat is black, the whinchat has a clear white streak over the eye; and the stonechat stays with us all the year round, while the whinchat is only a summer visitor. The two may also be distinguished by their voices; the call of the whinchat having two syllables, that of the stonechat three. Both species are fond of Furze bushes, and the whinchat is also much attracted by railway banks, on which it frequently builds its nest; so that they may constantly be seen from the railway train.

"OVEN-BIRD."

When in the neighbourhood of Furze bushes, you may sometimes come upon a most beautiful oval-shaped nest, covered with lichens; this is the home of the long-tailed or oven-tit. There is a minute hole in one side of the nest for an entrance, and so small is the interior that when the bird is sitting on the eggs it has to fold its long tail over its back, and the end may sometimes be seen projecting through the doorway. They lay a large number of eggs, and it is wonderful how such a large family can be brought up with such limited accommodation. They are very sociable, and large family parties may sometimes be seen flying about in search of food.

There are four other kinds of tits which are resident in England. They usually fly about in flocks, and are very sociable and tame, as those who are in the habit of hanging up lumps of fat for them in winter are aware. As a family, they have frequently been accused of damaging buds and fruit, but there seems little doubt that they are on the whole extremely useful, for they destroy an enormous number of grubs and maggots. *A. H. Macpherson.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

LÆLIA GRANDIS TENEBROSA.

MR. HOLMES, gardener to Geo. Hardy, Esq., Pickering Lodge, Timperley, Cheshire, sends two flowers of a three-flowered inflorescence of this rare and showy Orchid, which he states was purchased from Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, and Park Road, Clapham. The expanded side-sepals reach eight inches. The sepals are just under and the petals just over an inch in width. The beautiful labellum, which is shaped like some of the varieties of *L. purpurata*, is bluish white, richly veined from the base to the centre with purple, which between the lines and on the front of the lip changes to light rose. The sepals and petals have the usual coppery tinge of the best varieties of this species

The plant is said to be not yet strong. When established and grown up to the Pickering Lodge standard, it will be a marvellous form.

ZYGOPETALUM LINDENI.

A flower of this compact and elegant new introduction of Horticulture Internationale, Parc Leopold, Brussels, reveals an unexpected addition to the Zygopetalums of the *Z. rostratum* habit and general appearance, even although some of the botanical features of this may not agree with that species. The lanceolate acuminate sepals and petals are pale brownish-rose, about two inches in length, and the

Sheen, on the borders of Richmond Park, has acquired the character of being among the foremost collections in the country. This is doubtless due to the care which Mr. Young, who has the charge of the collection, cultivates his plants. The most prominent feature recently was a houseful of rare Cypripediums and Phalenopsis, the latter being the more abundant. Glancing along either side of the house in which the plants are growing, one was struck by the large array of flower-spikes presented; all are of fine quality, and nothing meagre is to be seen among them. Magnificent plants of *P. Schilleriana* with well-marked leaves, in some cases more than

A large batch of *Masdevallia tovarensis* made a snowy bank in the *Masdevallia-house*. A lovely form of *Cypripedium Leeanum excellens*, but which Mr. Young calls *superbum*, was in bloom, a most desirable plant, and I have rarely seen a better form of it. *Oloctoglossum*s were pushing ahead, with stout well-formed flower-spikes that promised to make a fine show during the early spring months. *Juno*.

CULTURE OF TROPICAL ORCHIDS.

Herr Richard Pfau, of San José de Costa Rica, lays down the following general rules in his catalogue of tropical plants, Orchids, &c., for the guidance

FIG. 169.—VIEW OF CHATSWORTH, THE SEAT OF THE DUKE OF DEVONSHIRE. (SEE P. 765.)

large ovate acuminate or nearly cordate white labellum is closely marked with crimson lines radiating from the fleshy, horse-shoe shaped callus at the base of the front. The fleshy column has two large hatchet-shaped wings, and the whole flower has a grace and novelty which should recommend it to all collectors of rare and handsome Orchids. It is a native of Venezuela, and the habit of the plant is similar to a strong-growing *Z. rostratum*.

PHALENOPSIS AT CLARE LAWN.

The collection of Orchids at the above pretty country residence of F. Wigan, Esq., situated at East

12 inches in length, and half as much in width, are subjects for admiration. *P. grandiflora*, *P. g. aurea*, *P. amabilis*, *P. violacea*, and others, were well furnished with flower-spikes. The Clare Lawn collection may almost claim to be unique in its possession of the rare and very beautiful *P. intermedia*, which had a spike of eight well-developed flowers, which are white, with a tinge of pink colour. Another very rare variety is *P. Portei*, which has large rosy-coloured flowers, much finer than those of *P. Schilleriana*. Other Orchids in flower were *Cattleya labiata*, many forms of *Laelia anceps*, including the white forms, which were just bursting.

of Orchid growers. His remarks are based on thirteen years' experience of the requirements and surroundings of tropical Orchids in their habitats in Costa Rica, Nicaragua, and certain parts of Columbia. He advocates the necessity of perfect drainage, and as thorough ventilation as is compatible with the necessary amount of moisture. If this be done, there is no fear of over-watering during growth. Baskets are preferable to pots, and the soil should be a mixture of potsherds, charcoal, and sphagnum—fibrous peat being only suited to strong feeders and semi-terrestrial species. Charcoal, saturated with ammoniacal gas, will strengthen the growth. Treat-

ment with rather cold water during summer will so harden many Orchids that they will survive the winter in an ordinary greenhouse or vinery.

RODRIGUEZIA PUBESCENS, *Lindenia*, t. 306.

Remarkable for its elegant pendulous racemes of white flowers. It is the old *Burlingtonia pubescens*.

CATTLEYA HARDYANA × VAR. LAVERSINENSIS, *Lindenia*, t. 305.

The variety here represented has the sepals marbled with pink on a light ground, the petals being of a deeper shade, and the front lobe of the lip very richly coloured. It appeared in the collection of Baron F. de Rothschild, Château de Laversine, France. *C. Hardyana* × is a hybrid between *C. Dowiana* var. *aureum* and *C. gigas*, and only occurs in that region of the Western Andes where the two species above-named occur simultaneously.

EGG-PLANTS.

SOME time ago, in passing a fruit shop in Regent Street, I saw in the window some fruits of the purple Egg-plant, *Solanum Melongena*. Of course, this is closely allied to the Tomato, but it does not appear to have taken the fancy of horticulturists; yet, when cooked, it is one of the most delicious of vegetables imaginable.

As there are Apples and Apples, so there are Egg-plants and Egg-plants. The white variety is sometimes cultivated in India, but it is the least valuable, as it is rather bitter; but the purple varieties are cultivated in fields everywhere, and much used by the natives and Europeans.

The best of all kinds which I have ever tried is one grown in Delhi, under the name of *Mároo Báingan*. *Báingan* is the native generic name of this plant, but *Mároo* is, I suspect, a corruption of the English word marrow, as, when cooked, its pulp has a marrowy delicacy. The fruit of this grows to the size of a child's head, and is of a light purple. I do not know the origin of the word *Báingan*. I cannot find this plant in De Candolle's *Origin of Cultivated Plants*. It may possibly be a South American plant, originally introduced into India by the Portuguese. The French call it Aubergine, and also *Melongène*; the Italians call it *Melingiana*; and the English in India often call it *Brinjal*. All these words, with the specific Latin name, *Melongena*, evidently have one derivation; and the Indian name, *Báingan* makes one suspect that it is a further corruption of the same name. In India, among dyers, the word *Báingni* has been adopted to indicate a purple shade of colour, so probably the cultivation of the plant is of old date.

As the French are fond of Aubergines, they should note that in Delhi are to be procured the seeds of a very fine variety. It is never certain, however, that a good variety in one place will maintain its fine character when grown elsewhere. Tobacco, Tea, Coffee, the Vine, &c., sufficiently show this; nevertheless, heredity, as they say in Hindostan, is *bari chiz* (a great thing); and it has often happened that a plant retains its good qualities in the country and soil of its adoption. Then, what is the use of man's intelligence if, having once got hold of a good plant he cannot make it stick to its character, or even improve it? We know that the Tomato in England is now a "how-is-it-we-ever-did-without-it" sort of both fruit and vegetable. The Aubergine ought, likewise, to hold in time a similar position as an adopted vegetable.

It is not impossible that such a fine thing has not taken the fancy of English growers because they have not hit off the right way of cooking it, although Anglo-Indian housewives must know a good deal about the way of managing it for the table; but they would like to find it in the shops at a reasonable price. I fancy it would admit of being grown in pots in summer, under glass, exactly as the Tomato is grown.

For the benefit of those who may happen to grow many plants of the purple variety, I herewith give

one of a dozen ways of cooking the Aubergine. In India, they have many varieties, some of them almost black, and as long and thin as Cucumbers; but the best I have ever tried is the *Mároo Báingan* of Delhi.

The rule is, first to "catch the best hare you can find." The stalk and calyx should be cut off, then the Aubergine sliced longitudinally, each slice of the thickness of about a quarter of an inch. Place them flat on a table or board, sprinkle salt over them, place another board on the top of them, and some weights on that. The object of all this is to drain off, by the help of the salt, the bitter juice which some kinds contain. I do not think the Delhi variety needs this trouble. Then wash off the salt, dry the slices in a cloth, and fry them in lard, or any other frying material. In Italy, they fry them in plenty of Olive oil (probably now they do it in Cotton-seed oil). In the olden time they used to call these fried slices of Aubergine, "quaglie" (quails), probably because they thought them delicious. Sometimes after drying in a cloth they are powdered with flour, which, when fried of a golden-brown, gives them a crumby appearance. Done in this way, they can be eaten with meat, or, French fashion, as a separate dish.

There are many other ways of cooking the Aubergine. Roasted, or boiled and peeled, and then squeezed in a cloth, they may be used in curries, in omelets, &c. They can be stuffed with force-meat and baked, and in several other ways; but as this is not a paper on culinary subjects, I shall end by stating that English growers and English cooks will be unwise if they do not take to the *Mároo Báingan* of Delhi. *E. B.*

THE BRENTFORD MARKET.

By a majority of 952 out of 1756 votes, the ratepayers of Brentford have sanctioned their Local Board of Health spending a large sum of money on the provision of a fruit, flower, and vegetable market at Kew Bridge. The proposal emanated from the Board in consequence of the multitudinous complaints received from time to time of the trouble caused to pedestrian and vehicular traffic by the congregation at Kew Bridge every morning of many hundred market-garden waggons, and with which the police seemed powerless to cope. As a matter of fact, costers and vendors of garden produce had established a market for themselves, and the authorities urged that the best way to meet the wishes of the townfolk would be to provide legal seats of custom. The move made was vigorously opposed in some quarters, and voting at a public meeting was very close, but the poll has cleared away opposition, and already the Town Surveyor, Mr. J. H. Strachan, has all the plans and drawings prepared. The land, which is to be purchased, consists of 2 acres, 2 roods, 30 poles, the property of Mr. Leopold de Rothschild, and situated on the main road from Brentford to London, close to Kew Bridge, and adjoining Kew Bridge Station on the North and South-Western Junction Railway. At present it is only proposed to deal with about one acre of the site, on which will be erected shops, and covered stalls, and standings will be laid down for waggons.

The business to be carried on in the shops to be erected will rest with the lessee, subject to certain ordinary restrictions, and already the Board has received applications from intending tenants. At the rear of the centre-shops is to be provided a coffee-stall. The covered stalls will consist of two rows, running backwards nearly the whole depth of space utilized, and below them will be a covered passage 50 feet wide, whilst the remaining three sides of the land will be devoted to five standings of waggons, each 11 feet wide, and by a paved way, 53 feet wide, between each. At present, there is no provision for stabling, but, with so much ground not utilized, there will be no difficulty in the construction of stalls for horses as occasion arises. From the situation, the promoters of the scheme are very sanguine of success,

and one went so far as to avow in public, that the market would rival Covent Garden. It is easily accessible from all the market gardens in the centre and west of Middlesex, and for conveyances from rural Surrey, Kew Bridge will do all that is needful, particularly now that the structure is to be widened, and its slopes improved. In the matter of railway facilities, the new market can vie with any in the kingdom, for if a branch line were run into its centre, garden produce could be transported direct north, south, east, or west by means of the Willesden Junction route, and at reduced expense to the consignees, the cost of carting being done away with. The price of the land is £3359 7s. 6d., and £4640 12s. 6d. is the estimated cost of laying-out and putting in order the market, which can be ready for occupation within twelve months of the Local Government Board sanctioning the necessary loans.

TREES AND SHRUBS.

POPLARS.

The white Poplar, *P. alba* of Linnæus, is a native of different parts of Europe, but has become naturalised to Great Britain and Ireland, where it reproduces itself by pushing up suckers from the roots; and as cuttings from the branches generally refuse to grow, these suckers should be carefully lifted and planted into nursery lines to form young trees. In cases where the roots do not produce suckers, the roots themselves may be extracted, formed into cuttings, and planted in nursery lines. It is but seldom that this species produces seed in this country, but the tree is often propagated by layering the shoots that spring from stools or roots left in the ground after the trees have been felled. The system of layering the shoots is the same as that given in my former article for the gray Poplar, and need not be repeated here.

There appear to be several varieties of this tree and it is a matter of much importance to planters to make sure that they propagate the best kinds when renewing their stock of plants. The distinguishing characteristics of the varieties are vigour of growth, hardness of constitution, size, colour, and shape of the foliage. The best kinds for ornament and utility are clothed with large deeply-lobed leaves of a dark green colour above, while the under surface is of a white silvery colour, and slightly coated with a soft downy substance.

The contour of the tree when young and in a vigorous state of growth is sharply conical, and when the leaves are agitated by the play of the wind, they exhibit a very attractive contrast of dark green and silvery-white colours, which never fail to attract the attention and admiration of the most superficial observer. This variety is generally known as *P. alba acerifolia*, and as it is of a hardy, robust constitution, I have planted it with perfect success as a standard at an elevation of about 1000 feet above sea-level. There is another variety known as the White Egyptian Poplar, the leaves of which are of a large size, with a fine glossy surface on the upper side, and the colours of green and white remarkably well pronounced; but as it is not so hardy as the former variety, it is best suited for planting as a standard, or mixed up with other trees in ornamental plantations to afford contrast and variety at low elevations. The whole of the Poplar tribe thrive best in a soft, deep soil, rich in organic matter; but in cases where it is desirable to establish standard trees on poor thin gravelly soil I have found it to be a capital plan to mix a quantity of peat-bog with the staple at the spots where the trees are to be planted.

This Poplar occasionally suffers damage in dry weather by a fungus blight, which appears on the back of the leaves about the time of harvest, when the leaves then gradually lose their vitality and fall to the ground, and by which means the tree is prevented maturing its young wood before winter; and I need hardly say that the progress of the tree is often

retarded to a considerable extent for several years after the attack. This disease is more prevalent in the east of Scotland and England than in Ireland, where the climate is more moist and genial, and the trees not apt to suffer so much from drought. The leaves of trees affected with this fungus should be collected as soon as they fall to the ground, and burned, in order to kill the fungus spores, and prevent them spreading.

When the wood of the white Poplar is cut up for use, it is found to bear a clean white colour, and a soft silky appearance when dressed and polished, which enhances its value very much for ornamental work of various kinds.

The Ontario Poplar, *P. canadensis* (Aiton), syn. *P. macrophylla* (Lindley), is a native of America, and in this country is generally called the Ontario Poplar. In this country it only attains a medium size of some 40 or 50 feet in height, and as its branches are remarkably brittle, and easily broken off by the wind, it should never be planted on exposed situations. When branches are torn off by wind, they often leave a scar on the trunk, which in due time becomes affected with parasite fungus, which lays the foundation for rot and decay, and renders the wood of little value, and accelerates the death of the tree. On inspecting some plantations last spring, I found several trees of this species badly affected with fungus growths. One tree in particular showed the fungus established at four different spots along the trunk. This fungus is known by the name of *Nectria distissima*, and generally appears in the shape of small warts around the margin of a wound on the host plant. This fungus, however, does not confine its attacks to any one species of tree, as I have found it attack many species of trees and shrubs in a similar way to that described.

The best remedy is to pare the lips of the wound with a sharp knife, remove all dead matter to the fresh solid timber, and finish by dressing the surface with tar to prevent the ingress of water and kill the fungus spores. The Ontario Poplar has very large leaves, the under-surface of which is of a whitish colour; in early life it makes rapid progress, and soon betokens a furnished appearance to the spot where it is planted. It is propagated by cuttings, and is best suited for planting on grounds of limited extent. *J. B. Webster.*

THE HOLY CITRON OF MOROCCO.

ONE of the most important articles of produce and export from Mogador appears to be Citrons, which are reported to have been shipped to the value of £592 in 1890. The larger proportion of these consist of the ordinary Citron of commerce, a very large and thick-rinded fruit, often of curiously-irregular shape, some being of bifurcated or trifurcated form. They are sent away in casks, preserved in brine, to be converted into candied peel; a good many, however, are used locally in native households as preserves or crystallised fruit. Consul Payton says there is also a curious, rare, and highly-esteemed holy fruit of this genus which is sold at Mogador at an average of 4*d.* per fruit, yet appears never to be eaten. It is the sacred or holy Citron of the Jews, and is carried to their synagogues at the feast of tabernacles, it having an emblematical significance. So highly-prized is this fruit by the faithful observers of Israelitish traditions, that specimens without blemish fetch as much as 4*s.* each at Mogador, and in England they are said to be sold at certain synagogues at the extraordinary price of from one to two guineas each. Their use is supposed to be derived from injunctions contained in the 23*d* Chapter of the book of Leviticus: "And ye shall take you on the first day the boughs (Hebrew version, fruit) of goodly trees, branches of Palm trees, and willows of the brook." But the Jewish version of the same passage reads: "And you shall take to yourselves on the first day the fruit of the tree Hadar, Palm leaves, boughs of the tree Aboth, and

willows of the brook." These special fruits, boughs, &c., are particularised in a Jewish book, entitled *The Festivals of the Lord*, as fruit of the tree Hadar or Citron (Hebrew troon), the "capoth temarium" or Palm leaves, boughs of the tree Aboth or Myrtle, and brook Willows. The troon, or tabernacle Citron as it is sometimes called, is a fruit rather larger than a Lemon, pale greenish-yellow in colour (being always plucked before it is fully ripe), and said to contain only one pip, and to be of an extremely pure nature, and to keep sound for a very long period. Those which are exported from Mogadore are carefully packed in cotton-wool or other soft material, as the price they will realise for their holy use is entirely dependent on the greater or less freedom from blemish, which the priests can certify concerning each specimen.

FIG. 110.—CEDAR OF GOA: CUPRESSUS GLAUCA.

Enquiry as to the exact locality of their production has resulted in fixing it at a place called Assats, or Assat, in the province of Soos, at no great distance from the town of Tarndant, and on or near the bank of the great Soos River. It is stated, with regard to this interesting place, that there is a very ancient Hebrew graveyard there, and orchards known by the names of Moses, Aaron, David, &c., also that the authority of the Moorish government is not respected there. Jewish informants state that these troons come from no other place but Assats, but they have been unable to explain how the faithful Hebrews in many far distant parts of the world manage to provide themselves with these necessary emblems, the shipment of which from Mogadore in one year amounted to 110 boxes, containing 9024 specimens of this interesting vegetable production. *J. R. J.*

THE CEDAR OF GOA.*

This fine Cypress, for it is no Cedar in spite, we might almost say by reason, of its popular name, is best known under the name of *Cupressus glauca*, sometimes under that of *C. lusitanica*. It was introduced into Portugal, but when, whence, and by whom are still matters of dispute. Much has been written on the subject, and the evidence pro and con, has been given by Prof. Henriques, Prof. Willkomm, and others. No such plant is known wild near Goa, nor is that a likely locality for such a tree. No such tree is known in the Nilgiris, nor in the Himalayas, unless, as Sir Joseph Hooker thinks may be the case, this Cypress is a variation of the Himalayan *C. torulosa*. It may be so; it is certainly more like that species than any other we can think of.

Under the circumstances, it may seem a little foolhardy to suggest another possible origin—and that is that the tree in question may be of Chinese origin, and may have been carried to Goa and to Portugal by the Portuguese missionaries. We have no evidence to offer in favour of the suggestion, but in this respect we are no worse off than our predecessors. We have been led to entertain the speculation solely from the number of analogous discoveries made of late in the mountains of Central China by Dr. Henry and by the French missionaries in Tibet.

Be this as it may, *C. glauca* forms an elegant tree, often with pendulous branches and loose habit, the imbricated foliage as well as the cones being more or less covered with glaucous bloom. It is too tender for central England, but in the south and west it might succeed, as it does in Ireland. Along the Riviera it does well. We have received fine specimens of it from M. Naudin, of Antibes, while the spray from which our illustration is taken was kindly sent us by Professor Henriques, of Coimbra. In the forests of Bussaco, near that city, are trees of this species 150 feet and upwards in height, and about 250 years in age. Others have been planted in more recent times.

A shows a small twig magnified two diameters. At b c are shown separate leaves, seen from the side and from the face. At d is shown the male catkin. At e, a vertical section through it. At f, a stamen detached, magnified four times. At g the cones are shown of the real size, though in some cases they are considerably larger. At h are shown cone scales, with their central hook-like process seen from the outside and from the side.

FLORISTS' FLOWERS.

CHIRYSANTHEMUM MRS. ROBINSON KING.

THE above is a deep yellow-coloured sport from Golden Empress, and originated at Mr. Robinson King's, North Ferriby, Hull, whose gardener is Mr. Hotham.

This is without doubt one of the finest additions to the incurved class ever introduced; it possesses all the excellent qualities of its parent in petal-formation, and size of flower, and it is as deep in colour as *Jardin des Plantes*. I exhibited it at several shows, and it was the admiration of everyone who saw it. I have seen several spurious varieties of Mrs. Robinson King, which are much lighter in colour than Hotham's variety. The entire stock of the plant has been acquired by Owen, of Maidenhead, and plants will be distributed by him in the spring. Such a grand acquisition as this is sure to be eagerly sought after, and find its way into many prize stands next year. *Peter Blair, Trentham Gardens.*

THE AURICULA.

The plants at this season should be at rest; but the difference in the seasons makes a great difference in this respect. Last year at about the middle of December the entire collection was

* *Cupressus glauca*, *Lamarck Dict.* 2, p. 243 (1790); Willkomm, in *Gartenflora*, March, 1890; *C. lusitanica*, *Miller Dict.*, n. 3; Lambert *Pinus* (1803), p. 95, t. 42; *C. pendula*, *Herit. Stirp.* (1784), p. 15, non Thunberg nec Lamarck.

frozen, and I do not remember another year when the leaves died off so suddenly and generally as then. Many of the December-formed trusses flowered outside of the leaves, a condition which is phenomenal. We have had a few slight frosts [Written before the present infliction. Ed.], but not sufficient to destroy the outer leaves of the plants, and the plants have consequently been more freely supplied with water. The plants should be gradually brought to rest, and the outer leaves will then gradually become yellow and may be removed, a rosette of stubby leaves remaining to protect its heart from moderate winter frosts, and when the plants have arrived at this stage they need scarcely any water. Once every week they should be examined, removing what is decayed. Sometimes a plant may be observed whose centre has begun to rot; that part affected should be cut out, and some powdered quicklime applied to arrest its further progress. Admit air freely to the frames, and remove the lights altogether on fine dry days. The young plants raised from offsets during the summer are looking well this year, and they have not ceased to grow all through the winter months, and could we be sure that no intense frosts would prevail later I would report them, but it is better that they should remain where they are in a cold frame at present. By taking precautions in the summer to scatter soot inside the frames, we have either driven away or destroyed the entire race of slugs. The plants will be placed in the heated house early in January. In this house are the seed pans, and the seeds are vegetating pretty freely.

CARNATIONS AND PICOTEES.

The weather was very rainy when the layers should have been rooting, and at the time of taking them off a considerable number had not formed roots at all, but even those that were poorly rooted very soon became established when stood in the cold frames, and despite the check the layers received when detaching their roots, they are now in capital condition. Our mode of action was to take the layers off carefully, and repot them at once in a compost that was moderately moist, and take them to the frames, keeping the lights almost close for a week or ten days, and any plants that exhibited signs of shrinking when air was admitted to the frame freely, were taken out and placed in close hand-lights for a time. Any stubborn rooting sorts should be placed in a frame over a dung bed, but the heat should be very gentle only. We planted out a long bed of plants raised from layers in good deep rich soil as late as the second week in November. A few of these plants shrunk visibly, and some of the more badly-rooted ones died; but we have always a reserve of plants to fill up gaps. Thanks to the favourable weather during the last month, the plants seem to be well established. Alternate frosts and thaws throw many of the plants not firmly established out of the ground, and these require looking to at once and pressing in with the fingers. The plants intended for pot culture, now established in small pots, and sheltered in cold frames, have been looked over once only, to remove all decayed leaves, and to stir up the surface soil in the pots. Not much water is needed at this season, but I fancy an error may be committed by keeping the plants too dry. They grow whenever the weather is mild, and rest in winter only when the temperature is below the freezing point.

THE PANSY.

This is one of the most charming of spring flowers, and has been cultivated more generally in the South during the last few years, probably because of the weather being favourable to it. Hot dry days are fatal to good results being obtained; but the effects of hot weather can be greatly modified by a good system of culture. The Pansy is supposed to be a common plant and easily grown, therefore it is put out in the borders to take its chance in any kind of garden mould; and as to propagation, if the tufts are pulled to pieces and stuck in again, that is enough. No wonder that hot and dry seasons play havoc with them. The plants like good deep rich loam, with

manure a foot or more below the surface, to feed the plants in dry weather. The soil must be open; heavy soil should be made so by road-scrappings or leaf-mould. The plants should be raised annually from cuttings, and really ought to be planted where they are to flower in September, so as to be well established for flowering early the following season. The early flowers are by far the best. To prevent them being broken, or injured by rough weather in winter, let the plants be pegged down to the ground; the flowering points soon turn up and stand free of the damp soil.

POLYANTHUSES.

The old florists still cling with fond affection to the laced varieties—they are the Polyanthuses, they do not recognize any other. I do not blame them, for they are amongst the most beautiful of hardy plants, but for border plants in the South of England they are absolutely worthless. They are beautiful cultivated as pot plants, and require the same treatment as Auriculas in autumn and winter, except that they really need more water. In the North, they are planted out-of-doors to regain their vigour. I tried this plan near London, and sought out a moist place, entirely shaded from the sun at noon-day; the most suitable compound was provided, but the results were not at all satisfactory. We put our plants out in the open ground as soon as they pass out of bloom about the end of April, and re-pot them again in September. The ordinary garden forms of Polyanthuses, and Primroses exhibited with them, at the National Auricula Society's exhibition pass nearly all their time in the open garden. They are taken up and potted when the plants are in bloom. They are both far more valuable than laced Polyanthuses as useful garden plants. *J. Douglas.*

NEW SINGLE-FLOWERED CHRYSANTHEMUMS.

The following are some of the best of the novelties in the above, and all are worth growing for decorative purposes or cutting:—Golden Star, large flower, quite circular, the tips of florets rounded instead of pointed, as is usually the case in single varieties; colour deep yellow, without verging to orange. Oceana is one of the best, the florets are semi-drooping at the points; a full-sized flower, pale pink in colour. Mrs. D. B. Crane, cerise-pink in colour, quite distinct from any other Chrysanthemum that I know of in this point. Jenny Lind has yellow flowers, tinted with orange. Miss A. H. Bates is pure white, and the flat petals are very broad for a single-flowered variety. Calliope is of a deep shade of pink. Milly Agate is bluish-white. Jessie Chignell, dark crimson; Exquisite, a most delicate blush. Coquette, rosy-pink; and Exquisite and Guernsey Sunset are charming varieties.

CHRYSANTHEMUM W. W. COLES.

Those persons who are in want of bright-coloured flowers during November, and the first two weeks of December, would do well to add this variety to their list if they do not already possess it, or to grow more of it. The colour is a bright terra-cotta, edged with gold, the florets are rather narrow, in many cases with just a slight curl at the tip; the flower is very full in the centre, which is not always the case with late-flowered sorts. The blooms keep fresh for an exceptionally long time when cut. A bloom is before me now, that has been in a warm room for a period of two weeks, and it is not faded. *E. M.*

VEGETABLES.

GOOD WINTER BROCCOLIS.

In addition to the list of varieties recommended by Mr. Wythes, p. 713, I should like to add Michaelmas White, which has kept us well supplied with tender white heads from the time the bulk of the autumn Cauliflowers was exhausted, at the end of October, until the present time. To follow this one, we have now Winter Mammoth, a variety every one having a strong retentive soil should grow. By its

appearance at present, we shall have abundance of white crisp heads for the next six weeks. Previously to growing Winter Mammoth, we were without Broccolis till the spring. Both of the above are Messrs. Suttons' strain. *E. Molyneux.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

CUCUMBERS.—With the past changeable weather less moisture will have been required, otherwise mildew and the decay of foliage would soon have appeared on the plants, and the chance of good Cucumbers would be small. There are a few important details to be carried out at this season which differ but little from those of the last few weeks. With cold nights some greater amount of artificial heat needs be applied, and an arid atmosphere must be by all means prevented, or insect pests will soon abound. As one of the means of averting this mishap, the glass should be covered at night. The bottom-heat should be carefully attended to, adding new fermenting material when required, 80° being allowed as the minimum. Afford occasional watering with warm liquid manure, and continue the top-dressings with light rich compost. Give air in bright weather for a few minutes so as to dry the foliage, and crop sparingly till growth begins to increase. Plants for fruiting in February and onwards should be kept cooler than those, and no fruit allowed to set till that time has come. A few cucumber seeds may be sown, two in a small 60-pot, and placed in a frame with brisk bottom-heat. When they are up keep them near the glass, and when it can be seen which is the stronger, pull up the other. Repot low in the pot, and mould up twice.

MELONS.—Those who may require to have ripe Melons in the month of May, should sow a few seeds in the way advised for Cucumbers; and for such early forcing I would advise for choice an early kind with a thin rind, and also to grow them in large pots or tubs, keeping the bine near the light.

STRAWBERRIES.—Of these, a few of the earliest varieties should be brought indoors, viz., Vicomtesse H. de Thury, which is one of the earliest flowerers, and La Grosse Sucrée, which is equally good. There are a variety of ways of starting Strawberries for early fruiting, and numerous shifts have to be made by gardeners; but the best one is to plunge the pots in a mild hotbed of tree leaves, and keep them close to the glass. The temperature may be from 45° to 50° at the start, the lower degree of warmth at night. For early forcing, I like to have the plants in 5-inch pots, each plant furnished with a single plump well-ripened crown, and healthy roots. Plants may also be placed on shelves in fruit-houses just started, and thus brought on gradually. In preparing the plants, see that the drainage is perfect; and with small pots, I prefer to remove only loose soil on the surface, and not to take away a lot of it. A good space for holding water is essential, and for the addition of a feeding mulch. Plants for succession should be examined, thoroughly watered if dry, and kept cool till required.

TOMATOS will now make slower progress, and all the energies of the plant should be directed to swell up and finish the fruits, as it will be found impossible to get fruits to set for some time yet. Continue to apply stimulants to healthy plants, and afford them a little more warmth and air on all occasions when prudent in the early part of the day, and in mild weather leave a chink at the top ventilators at night. *G. Wythes, Syon House, Brentford.*

THE FLOWER GARDEN.

ODD JOBS AND BACKWARD WORK.—Advantage should be taken of the frosty weather to turn over and re-turn the accumulated rubbish of the current year, so as to convert it into fairly good manure, which well-rotted short grass mowings, weeds, sweepings of walks, leaves, and other vegetable matter undoubtedly make, with which to dress the beds and borders. Of course, the rubbish is situate in some out-of-the-way corner, away from the vicinity of the flower garden or grounds. It should consist of three sections, side by side, one consisting of fresh rubbish, another that of 1890, which will be partially rotted, and thirdly, that which is fit for use. Composts used in the raising and potting of bedding-out plants should be prepared in due proportions, say

three parts of waste or other soil and one of leaf-mould. By turning it over a few times in as many days, the exposure to frost will sweeten it, and destroy many grubs, insects, &c.

Walks and road-making, which in many low-lying places could not be got on with in consequence of so much rain having fallen, should, now the ground is firm, be proceeded with in earnest. And for the same reason gravel should be carted on to any walks requiring a coating of the same. Also the trunks of large trees blown down during the recent gales, and which the condition of the ground did not permit of being sooner removed, should also have attention as soon as the work can be done without injury to the turf or gravel. Where the mulching of Rose beds has been deferred, it should now be performed, putting on them a coating 3 inches thick of good well-rotted manure, which will at the same time serve as a protection against frost.

IVY ON TREES.—While the growth of Ivy is to be encouraged on the trunks and branches of decayed and decaying trees, it should by no means be allowed to establish itself on young trees that we wish to see grow into large specimens, or on established trees whose life and vigour we wish to increase rather than diminish. Therefore, a man provided with a light hatchet should look over the trees, and cut the Ivy off close to the ground of any trees which it is not deemed desirable to drape with its green tightly-gripping shoots, which, if allowed to remain, they would ultimately kill. After the Ivy is cut off at the base of the trees, it can easily be torn off the latter, if not well-established, in which case it may be necessary to cut the several leading shoots or branches into short lengths in order to facilitate their removal.

PROTECTING TENDER SHRUBS.—Such plants as Myrtle and *Aloysia citriodora* (lemon-scented Verbena), will be the better for a little protection being given them in most counties, excepting a few favoured spots in the south of England and Ireland. A few inches thick of sifted coal-ashes placed over the roots, and a mat or two over the branches (if trained against a wall or fence) at night will prevent their being injured by frost. If grown in bush form, as is frequently the case, the branches can be tied together, and dry Fern or Bracken worked among and over the shoots, and then tied and trimmed into a pyramidal shape, thus making them secure from frost for the whole winter.

BEDDING PLANTS.—See that all kinds of bedding plants requiring protection from frost receive it, and ventilate the pits, frames, and houses in which they are growing freely on every favourable opportunity that presents itself so as to preserve a sturdy growth. *H. W. Ward, Longford Castle, Salisbury.*

THE KITCHEN GARDEN.

CAULIFLOWERS.—Seeds of varieties of these of which Sutton's First Crop, Magnum Bonum, Pearl, and Veitch's Extra Early Forcing, are types, may now be sown, and again early next month. Sow thinly in with warm soil in pans or boxes, and keep the plants from the first close to the glass, and afford them as much air as the weather will allow, still keeping them in a gentle heat. When a pair of true leaves are grown, prick them off into smaller pans, &c., of sifted sandy loam and leaf-mould, about 3 inches apart. Sow a small quantity of Stuart & Meim's No. 1, Ellam's Early, and Sutton's Earliest, Flower of Spring, and All Heart Cabbages, and treat these seeds like the Cauliflowers. These Cabbages will come in close upon the heels of the autumn-sown Cabbages, and be more tender and succulent than those.

LETTUCES.—Seed of Cabbage and Cos Lettuce should be sown, and usually one pan of each will be found sufficient for the first supplies. Sow on the surface of soil that has been made warm, and place the pans in some pit or house where there is a warmth of 55° to 60° at night. When the seeds have germinated, place the pans, without delay, near the glass, and as soon as the plants can be handled, prick them out in a slight hotbed, or in boxes, at 3 inches apart. For varieties, Commodore Nutt and Golden Ball, among Cabbage Lettuces for early forcing, and Paris White Cos are amongst the best.

PEAS AND BEANS.—Make a sowing of Peas, either in boxes on turves or 60-pots, and if the latter, put a dozen Peas into each. The pots or boxes should be three-quarters filled with holding turfy loam and leaf mould, covering the seeds to the

depth of 1 inch. Place in gentle heat until the young plants appear above ground, and keep them close up to the glass. When the plants are 1½ inches high, remove to a cooler and better ventilated house or pit, so that sturdy growth is made, affording air less fully at first than no check to growth may occur but after a fortnight ventilating freely when the weather will admit of it. *Chelsea Gem*, *William Hurst*, *Veitch's Extra Early*, *William the First*, and *Sutton's A 1*, are all good varieties for early sowing, and the two former are suitable for planting in pits or 8-inch pots for yielding the earliest gatherings.

BEANS should also be sown in boxes for planting in favourable sites out-of-doors, when it is considered safe to do so; *Mammoth Longpod* and *Giant Seville Longpod* are good early varieties. Use strong loam and leaf-mould in a partially rough state, and the plants will lift well when transplanted, and scarcely any check will be caused by the operation. Dibble or place the seeds 2½ inches apart in the boxes, and cover them with an inch of rather finer soil than that beneath, and do not put the Beans when sown in a forcing temperature—a temperature of 45° at night, and 50° or 55° by day, will be suitable for ensuring sturdy growth.

MISCELLANEOUS.—Continue to put into heat *Seakale* roots, *Witloof* (*Chicory*), *Rhubarb*, &c., so that no break in the supplies occurs. *Mint* and *Tarragon* roots and seeds of *Chervil* may be planted and sown at regular intervals. Examine all roots in store, removing all that show signs of decay. Advantage should be taken of frosty weather to wheel out manure on to all such vacant plots requiring it, placing it in compact heaps. Refuse heaps may now be turned over, picking out sticks, large stones, &c., as the work proceeds, sprinkling fresh lime over it as each piece is turned over. Where much ground is going to be trenched, this refuse may be wheeled on to the quarters, to be put during the trenching into the bottom of the trenches. Trimmings of hedges and other kinds of rubbish may be collected and burned, saving the ashes for future use. All indoor work should be pushed on during frost and wet weather.

The affairs of the garden may now be reviewed in detail, this being the best time for doing so, before ordering the seeds for next year's supply, making notes of those which have done well, whilst the matters are still clearly remembered. *C. J. Waite, Glenhurst, Esher.*

THE ORCHID HOUSES.

THE EAST INDIA HOUSE.—The earliest blooming *Phalenopsis*, *P. amabilis*, and *P. grandiflora* are now opening their flowers, and at this dull season are very useful. Newly-imported plants are now in the market, and they could not arrive at a better time, as a long season of growth is ensured. In previous Calendars I have mentioned that these *Phalenopsis* are easily managed when bought as fresh imported plants. A large amount of moisture in the atmosphere and at the roots should now be avoided, this being the chief cause of failure with these plants; heat must also be reduced. If these points are neglected, discoloration of the foliage will set in, and the loss of the leaves will accrue. If taken in time, this can be easily avoided. Any plant affected should be placed in a very light position in the house, and kept dry. If the leaf is too far gone to be saved by this means, prick around the affected part with a needle, making it go entirely through the leaf at each insertion, but no sulphur or pounded charcoal must come near the leaf. The action of the air will entirely dry up the wound, and, although spoilt in appearance for the time being, the plant will be in better health and strength for a strong growth the following season than if the leaf was entirely cut away. A temperature of 63° at night, falling to 60° in the morning, is quite sufficient for *Phalenopsis* at this season, and a lower temperature for a short period will do no harm; but the greatest care must be taken to avoid drip from the roof-glass. Where the temperature cannot be kept up without making the hot-water pipes very hot, it is much better to place Archangel mats or old shadings on the roof-glass and around the sides of the house, for fluctuations in the temperature are very injurious to *Phalenopsis*.

THE INTERMEDIATE-HOUSE.—One of the most satisfactory plants to grow in this house is *Epidendrum Wallisii*. For fully three years we have never been without flowers of it, though naturally at some seasons we have more than others.

Sophronis grandiflora is also another beautiful Orchid for flowering at this season, and is easy of cultivation, but it must not be grown in the cold house as is sometimes advised; the plants do much better when grown in the intermediate-house. The latter plant and *Masdevallia tovarensis* mixed, together with pots of *Maidenhair Fern*, make a beautiful effect. The temperatures for the *Cattleyas* should be 60° at night, intermediate house 55°, *Masdevallias* 50°, *Oncoglossums* 45°, and a degree or two lower on cold nights will do no harm. *A. G. Catt, Parkfield, Hallow.*

PLANTS AND THEIR CULTURE.

CROTONS.—Large plants of *Crotons*, which were cut back as advised in a previous Calendar, will have commenced to break freely, and should be syringed lightly on bright days with tepid water, which will assist them to break more regularly. Clean the plants thoroughly, and be cautious in not over-watering at the roots until the young shoots get into full growth and the roots begin to move freely.

PANDANUS.—Old plants of *Pandanus Veitchii* throw off a number of suckers from their base, and these may be propagated as soon as they have attained the proper size. Place the suckers separately in small pots according to their size, using a compost of two parts loam and one each of leaf soil and silver sand. After potting, place a small neat stick to each sucker, encircling the leaves with a small piece of bast, and place in the propagating frame until rooted. By propagating at different intervals, they will be found more useful for forming a succession for table decoration.

CINERARIAS.—The earliest plants are now in full bloom, and are most useful for decorative purposes. Take precautions that damp does not affect them. Admit air on all favourable occasions, and look over the plants once or twice each week, removing all decayed leaves, &c. The successional plants which are commencing to show for bloom should be assisted with weak manure-water afforded once a week. Keep the plants well up to the glass, always keeping a little air on, except when there is danger of frost, and only use fire-heat to expel damp and frost. Should there be the least sign of green-fly, have the plants fumigated before the blooms expand. Any plants requiring a shift into larger pots should have attention, using a compost of three parts fibrous loam, one each of leaf-soil and decayed manure, with sufficient sand to keep the whole porous.

ZONAL PELARGONIUMS.—When well-grown these are always useful during the winter, and if growing in a suitable structure, there should be no lack of bloom at the present time. Damp is their worst enemy; therefore keep the hot-water-pipes warm during damp weather, and give air on all occasions when the outside temperature is favourable. Look over the plants twice each week, and pick off all decayed leaves and flowers. When giving water, take care not to spill any about the stages, walks, &c. Young plants established in 4 or 5-inch pots should have a little guano given them. *R. Milner, Penrice Castle, Swansea.*

THE HARDY FRUIT GARDEN.

As long as the frosty weather lasts attend to all newly-planted trees, especially where rabbits and hares abound [and goats, &c.] Protect the stems by placing strips of wire netting around them. Painting the bark over two feet or more from the ground with a mixture of soft soap, soil, soot, and paraffin will also keep rabbits and hares at bay. The operation should be repeated when necessary. Staking and re-staking the trees should now be done, taking precaution that the bark does not rub against the stakes. Where stakes are used for supporting orchard trees, two should be driven a foot into the earth at 16 inches apart, and a cross-piece of wood nailed at the proper height, to which the stem should be tied, placing a pad of hay or straw between the ties. Advantage should be taken now the ground is hard to get soil, &c., for further top-dressing or planting, wheeled or carted to where it will be most needed.

Goose-berry bushes should be watched, or birds, especially sparrows, will soon destroy the buds. Soot and lime, well mixed, and strewn over the bushes at intervals will, to a great extent, prevent much harm being done. Red and white Currants may be pruned when the frost is not severe. *H. Markham.*

EDITORIAL NOTICE.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

WEDNESDAY, DEC. 30 { Dutch Bulbs and Roots, Palms
Greenhouse, and other Ferns, at
Protheroe & Morris' Rooms.
FRIDAY, JAN. 1 { Important Sale of Established Or-
chids, from a private collection,
at Frotheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—37°.3.

WITH a fog so black at mid-day that the houses on the opposite side of the street are invisible, we might be excused for looking forward to the prospects of the future, rather than for dealing with the fact of the present. Our duty at this moment, however, is rather with the past than with the present, and not even the fog can annihilate our feelings of gratitude for the many manifestations of goodwill that were showered upon us on the occasion of our Jubilee. This time last year it was our pleasing duty to review the events of the last half-century as chronicled in these pages, and the summary we were then able to give excited much attention among those interested in the progress of horticulture. Of the share we have taken in it we need say nothing—others have done it for us in every quarter of the globe, so that we have but to repeat our deep appreciation of their kindly feeling.

As to the year that is now at end, it has been marked by several features of great interest, to some few of which we must allude in passing. First and foremost we would place the question of horticultural education. The various County Councils have, from causes into which we need not enter, been placed in a position to further technical education in various subjects, and among them horticulture. As a matter of principle, we can but rejoice at this; as a matter of practice, we can but regret that the announcement of the good news has come at last so suddenly that we fear it finds many unprepared to turn the circumstance to proper account. It seems almost certain that mistakes must ensue, and disappointment be faced, ere the subject of horticultural education can be properly dealt with. Gardening as a practical art must be learned in the garden by practice alone. But gardening is something more than a mechanical art, it is, or should be, the outcome of intelligence brought to bear on practice. As at present picked up—we cannot say learnt—it is apt, as we all know too well, to degenerate into mere routine and rule-of-thumb procedure. This, excellent as it is in its way, requires to be leavened with intelligence, if progress is to be made, and new conditions are to be encountered.

The practitioners of an art naturally feel that practice is what is essentially required, and so it is; but to direct, control, and improve that practice, knowledge is required. Practitioners are apt to fight shy of "science," theory as they call it, and do not sufficiently recognise that science is only a grand name for knowledge and theory, only the equivalent of that orderly intelligence, by means of which the powers of knowledge can be turned to the best practical ac-

count. No amount of lectures or book-reading can make a gardener, but a gardener can make much more rapid and much more satisfactory progress if his head is made to work with, and direct the work of, his hands. Practical gardening, as such, has reached its highest level in this country. The ways and means and the material have vastly improved during the last half-century; but if we eliminate these, we greatly doubt if the merely practical gardener is any better than his predecessor of fifty years ago. How should he be? This is not our opinion only, but that of many of the leading practical gardeners themselves, as was noted when we were discussing these matters. If this be true, there is an ample reason for urging an improved educational system in order to allow us to take full advantage of the material benefits which the progress of science has put at our disposal. Again, the gardening calling, as a whole, is, no doubt, greatly overstocked and woefully under-paid. There is no more room for mere routine practitioners; but, on the other hand, there are many openings for properly-educated and properly-trained gardeners which were not available fifty years ago. The development of our colonies, the necessity at home of making the land more profitable than it now is, offer opportunities for the trained and educated gardener that he had not before. These very conditions render the prospects of the untrained and uneducated more hopeless than ever.

The prospects of hardy fruit culture, which are decidedly brighter than they were, do but add an additional illustration of the validity of our argument. No doubt we can in this country—and in some cases we do—produce better fruit than is yielded by any other country, under at all like circumstances; but look at our neglected orchards, and at the wretched quality of much of the fruits exposed for sale in the greengrocers' shops, and the need for intelligent cultivation is painfully made apparent. Let us look again at the questions relating to plant diseases. Who can estimate the annual loss caused by insects and by various fungi? Are we to go on for ever taking these things as matters of course which must be endured, or ought we not to set to work vigorously to devise means, at least, to palliate their evil effects? We cannot do this without the aid of science. We must first of all know all that can be known of these organisms and of their ways of life, and then we shall be in a fair way to deal with them. Take the Potato disease, as a case in point. There can be no doubt, in spite of some adverse experiments, that we are now in possession of various means which, if properly carried out, will very materially diminish the evil effects of this pest. Apathy and ridicule will do nothing, but well-devised operations will have, at any rate, a large measure of success.

The general course of events in the horticultural world during the past year has not, with the exceptions we have mentioned, furnished much material for comment. The crops have been fairly good, and the general outcome has been better than the nature of the season promised. Flower shows have been as numerous, if not more so, than ever; but whether they have increased their powers for good, as regards the progress of horticulture, is doubtful.

The fortnightly meetings of the Royal Horticultural Society have been as full of interest as they generally are, and among the larger events the Temple show, the shows at Manchester and at Edinburgh, have been above average. The Conifer Congress at Chiswick,

ruined in some respects by the weather, was, nevertheless, the means of bringing together the largest and most instructive display of these plants ever witnessed, and the papers read at the conference were of so high a quality that we anxiously await their publication in the *Journal* of the society, more especially from the point of view of practical forestry.

The garden charities have been well supported, but the lists before us show, unfortunately, how inadequate they are to cope with the requirements of the case. The practical inference from this needs no insistence.

The publications of the year have been very numerous, but, with a few exceptions, they have not been equal in merit to the flood of publications on horticultural and cognate subjects which reach us from Germany and other countries. Of purely botanical publications we can make no mention, but we cannot avoid referring to Professor SAROENT's magnificent publication on the *Silva of North America*, an illustrated work of reference, which, from its cost, is not accessible to many individuals, but is one which no library with any claims to comprehensiveness should be without.

The Obituary list last year was terrible, not only in numbers, but for the havoc it recorded among prominent horticulturists. It is not much better this year. We have lost the Emperor of BRAZIL, a man who like the Duke of DEVONSHIRE, whose loss we have to announce to-day, owed his reputation far less to his high rank than to his intelligence and ability. The Emperor was not only a patron of science in the best sense of the term, but a man of science himself and one to whom horticulturists owe much more than they are at all aware of. France has lost two men of foremost rank in the horticultural world, HARDY and ALPHAND, men that France will find it difficult to replace. LEVET also will long be regretted by Rose growers, and HERINGQ will be missed from the small band of garden botanists. Belgium has lost VAN VOLXEM, Italy mourns RICASOLI, both men who greatly advanced horticulture. For ourselves, we have lost the veteran SCHOMBURGK, who did such valiant service in South Australia; Dr. HENRY BENNET, the founder of Mentone, and who was one of the first to perceive the importance of observing the phenomena of vegetation, and co-relating them with those of climate for the benefit of his patients; BARRON, "of Elvaston," a sagacious practitioner with a knowledge of trees and their ways, especially of Conifers, and who has been taken from us at a ripe age; DOMINY, the hybridist, to whose labours we owe so much; JEAN SISLEY, unless we are to count him as a Frenchman; MESTON, the landscape gardener; FRANK MILES, artist and gardener; WILLIAM RICHARDS, known to many as the publisher of this journal, and whose help when any charitable enterprise needed assistance, could always be counted on, must be numbered in the sad list. These, and, unfortunately, many more, might be cited; but before we close the list, we must not omit two names which are eminently suggestive—EDMUND ROGER CUTLER, by whose efforts, mainly, the Gardeners' Benevolent was raised from an institution pensioning with difficulty one or two members a year, to its present state, when its pensioners number a hundred or more, and its invested funds afford the best proof of its ability to do more in the future, if the gardeners will only continue their much-needed support. The last name on the list that we will mention is that of JAMES WELLS, centenarian, and we do so because we hope his example may serve to stimulate others. We do

not know that he had many claims to notice as a horticulturist, but he was more than a centenary, and he did his duty to the Gardeners' Benevolent and to his fellows by subscribing a guinea a year as long as he could—eighteen years; and then when he could no longer work, and circumstances were against him, he claimed the advantages of his foresight, and received as a matter of right, not of charity, assistance from the institution he had helped to support to the extent of £520—a pretty good return for his investment, if we look at the matter from that point only.

And so with this hasty summary we pass from our Jubilee year to another period of uncertain duration, but cheered and encouraged by a largely increased circulation, and by the goodwill of our numerous friends. With their suggestions to guide us, and their help to support us, we trust to do good service to horticulture in the future, as it is acknowledged we have done in the past.

THE QUEEN AND HORTICULTURE.—The Gold Medal of the Royal Botanical and Horticultural Society of Manchester was awarded to Her Majesty the QUEEN for her exhibition of fruit at the recent show in this city. Mr. BRUCE FINDLAY, the Secretary of the Society, proceeded to Windsor Castle and presented the Gold Medal. In acknowledgment, Mr. FINDLAY has received the following letter:—

Windsor Castle, December 16, 1891.

"SIR,—I am commanded by the QUEEN to convey to the members of the Royal Botanical and Horticultural Society of Manchester the expression of Her Majesty's thanks for the Gold Medal which the Society has awarded to her for the fruit exhibited by Her Majesty on the occasion of the last exhibition there, and to express Her Majesty's satisfaction that the Apples and Pears sent from the Royal Gardens should have been so highly approved of by the Society.—Believe me, yours faithfully,
"J. C. COWELL."

"BRUCE FINDLAY, Esq., Secy. Royal Botanical and Horticultural Society of Manchester."

VEITCH MEMORIAL PRIZES.—At a meeting of the trustees of the Veitch Memorial Fund, held on Friday last, the 18th inst., at the office of the *Journal of Horticulture*, Dr. ROBERT HOOG in the chair, it was decided to offer Veitch Memorial Medals and prizes for the year 1892 as follows:—(1) At the Temple show of the Royal Horticultural Society, on May 27, a Medal and prize of £5 for the best six hard-wooded greenhouse plants in bloom; (2) at the special exhibition of Orchids at the Royal Botanic Gardens, Manchester, to be held in June, a Medal and prize of £5 for the best hybrid Orchid in bloom already in commerce; and (3) a Medal and prize of £5 for the best hybrid Orchid in bloom not in commerce. These Medals and prizes can be competed for by amateurs and their gardeners only. It was also decided to award a Silver Medal to Mr. WILLIAM WATSON, of Kew; and a similar Medal to Mr. JOHN HEAL, of the Royal Exotic Nursery, Chelsea, as a recognition of their skill as hybridisers and cultivators.

ROYAL HORTICULTURAL SOCIETY.—As it has sometimes been made a subject of complaint that sufficient means are not taken to make the Fellows acquainted with the conditions under which alone their privileges of recommending new members for election into the Council can be exercised, we desire to call attention to the following notice published in the last number of the society's journal:—"Any two Fellows may recommend any other Fellow for removal from, or election to, the Council, or for appointment to the offices of President, Treasurer, or Secretary, and Auditors, such Fellows leaving notice in writing of their proposal at the offices of the Society on or before the 10th day of January in each year."

THE DUKE OF DEVONSHIRE.—The praises of the Lord of Chatsworth are being pronounced by men of all parties and all creeds. A Duke—an owner of many thousands of acres in various parts of the country, and also in Ireland—he was more

than all these, he was a just and considerate landlord, a double-first at Cambridge, a Smith's prizeman, a patron of art, science, and literature, and well upheld the name of Cavendish in matters of science. For many years he was Chancellor of the University of London, and of that of Cambridge—positions to which his personal qualities entitled him still more than his hereditary rank. The Gardens of the Royal Horticultural Society at Chiswick are rented on very favourable terms from the Duke, one of whose predecessors was the patron and friend of Sir JOSEPH PAXTON. We may remind our readers that on June 26, 1875, we gave in our Chatsworth Supplement, a view of the house, now reproduced on p. 759, and also of the great conservatory, the Musa avenue, the tank in the conservatory, the interiors of the Victoria House, and the great conservatory, the Amberstia, since dead, the Italian garden, and others.

CHRISTMAS NUMBERS.—*Amateur Gardening* presents its readers with a coloured plate of new early-flowering Chrysanthemums, and a variety of useful and seasonable articles, mostly practical, some scientific, others recreative. The *Gardeners' Magazine* has a brilliant coloured almanack, articles on Stratford and Hatfield, a Christmas story by Mr. G. M. FENN, another by Mr. BURNIBØE; a pleasant account of the Norfolk Broads in Winter, while Mr. BUNYARD burgesons forth into poetry as he catalogues the Apples in the fruit-room. The *Vegetarian* has an illustrated article on the Gardens at Lamport Hall, with their whimsical conceits, concerning which people form as many different opinions as they do about the gardens at Isola Bella; Mr. E. J. BAILLIE has a Christmas-tide reflection—one which entails no remorse for the past, but one which is full of hope and promise for the future.

MEETING OF THE GERMAN GARDENERS' CLUB.

—A number of young Germans perceiving the advantages of having a place of meeting for mutual help and instruction, established some fourteen years ago, a club, with a very low weekly subscription from its members. This modest institution, with members at no one time exceeding fifty in number, had its *locale* for many years in a back street off Sloane Street, but it has had recently to migrate to Soho, owing to the demolition of its original quarters, and is now located at WEDDES' Hotel in Greek Street. On Saturday last was held at the latter place its fourteenth anniversary festival. The attendance numbered some forty sons of the Fatherland, who had assembled in a thoroughly homely manner, with a plain supper, song, and speech, and a very enjoyable evening was spent. On ordinary meeting nights, the first and third Saturdays in each month, papers are read on various topics of horticultural interest, certain articles read from the best English and foreign gardening journals, and criticism and general discussion are invited thereon. We hope to be able on some future occasion to lay before our readers the proceedings at one of these meetings, which resemble with some differences, those of our Mutual Horticultural Improvement Societies and Associations. The President of the Club is Mr. KRUMBEIGEL, who is employed in the Royal Botanical Gardens, Kew.

L'ORCHIDÉENNE.—The thirty-second meeting of this Society was held in Brussels on December 13 at the Horticulture Internationale, when a remarkable show of Orchids was staged, including several interesting novelties, some splendid Cypripediums, and an unusually good display of Odontoglossams. We may mention *O. Alexandræ* var. *nebulosum*, very charming and striking; *O. Alexandræ* var., specked with salmon, of elegant colouring; the following well-grown Cypripediums, *C. Spicerianum*, *C. Williamsi*, *C. insigne* Chantini, and also *C. Sallieri* Hyeannum, the latter of unusual height, and bearing nineteen flowers; *Odontoglossum ramosissimum*, *O. Halli leucoglossum*, *O. pulcherrimum*, bearing four dense clusters of flowers; and the new *Vanda Warocqueana*, with a quadruple cluster, from M. G. Warocque. The following Orchids were also admirable:—*Cypripedium Rothschildianum*, the new *C. insigne* Moensi, pale in colour, and of good habit;

and *Cattleya xanthoglossa*, from M. J. Moens, *Cypripedium Leeaanum superbum*, covered with bloom; *C. cœnantium superbum*, *Epidendrum ciliare*, a dense mass; *Brassia* sp., and *Lælia Gouldiana*, well-bloomed, from M. A. Van Imshoot; *Odontoglossum hastilabium*, beautiful and well bloomed; and *Cypripedium bellatulum*, with very large flowers, from M. G. Miteau; a splendid mass of *Cypripedium insigne*, from M. Madoux Fils; a Hybrid *Cypripedium*, and *Odontoglossum Wilckeanum* var., very elegant, from MM. Vervæet & Cie.; excellent varieties of *O. Alexandræ*, *O. Ruckeri*, *O. tripudians*, and *Cypripedium nitens superbum*, from M. le Dr. Capart; the charming *Oncidium cucullatum* × *Phalaenopsis*, a natural hybrid, intermediate between the two species; *Dendrobium bigibbum* var. *mar-moratum*, very finely coloured; *Mormodes Rolfeana* var. *lineatum*, the curious *Eulophia* sp. *Oncidium Bungeothi*, *Odontoglossum crispum* var. *lilacinum*, *O. blandum* var. *maximum*, *Lælia anceps Walkeriana*, *Cypripedium Argus* Moensi, *C. Leeaanum superbum*, *Bletia cateaulata*, *Odontoglossum Boddertianum*, *Masdevallia bella* and *M. Veitchi grandiflora*, *Cattleya Holfordi*, *Cypripedium Leeaanum* var. *Jacksoni*, *C. Dauthieri*, *C. cœnantium*, *Spathoglottis Augustorum*, *Aganisia discolor*, all from M. Linden; *Dendrobium formosum giganteum*, and *Lælia anceps* var. *Walkeriana*, with unusually large flowers, from M. Treysan; *Odontoglossum Rossi*, with large and well-coloured flowers, from M. J. Van Lansberge; *Cypripedium Röbelini*, well-flowered, and *C. hirsutissimum*, from M. Ch. Van Wanbecke. The jury, which was composed of MM. G. WAROCQUÉ, President; Em. RODIGAS, Secretary; Dr. CAPART, Houzeau de Lehaie, F. KEGELJAN, Huybrechts, G. Miteau, J. Moens, and A. Van Imshoot, awarded many diplomas and certificates for the above excellent collections.

LINNEAN SOCIETY.—At the meeting of this Society on Thursday, December 17, Professor STEWART, President, in the Chair, Mr. G. C. DRUCE exhibited specimens of *Sagina maritima*, Don MS., var. *alpina*, Syme, gathered on steep rocky places on the Cairngorms; and of *Illecebrum verticillatum*, Linn., found near Wellington College, Berks. Dr. R. C. A. PUNO exhibited some fruits of the Baobab (*Adansonia*), and of an undetermined species of Palm, which had been sent from Matabeland as good to eat, under the misleading names of "cream of Tartar fruit," and "wild Orange." He read an extract from Oates's *Matabeland*, describing the natural growth and appearance of the Baobab as observed in that country.

DEVON AND EXETER GARDENERS' ASSOCIATION.—On Wednesday evening, December 16, the usual fortnightly meeting of the Devon and Exeter Gardeners' Mutual Improvement Association was held at the Guildhall under the presidency of Mr. D. C. POWELL. The ordinary business of the meeting having been transacted, the Chairman introduced Mr. W. ROWLAND, who read a paper on the "Cultivation of the Tomato."

CALENDARS AND ALMANACKS.—We have received from Messrs. WARD, LOCK & Co., publishers, Warwick House, Salisbury Square, E.C., *Glenny's Illustrated Garden Almanack and Florist's Directory for 1892*, which, besides the usual matter found in an almanack, has figures of new Strawberries, Onions, Tomatos, and Potatos; the novelties in flowers, fruits, and vegetables, for the period, September, 1890, to September, 1891, some of which are figured; models of improved boilers for heating glasshouses; propagating cases, mowing machines, &c., and a trade directory. *Calvert's Mechanics' Almanack* is published by JOHN HLEXWOOD, 1, Paternoster Buildings; SIMPKIN & Co., Stationers' Hall Court, and others in London; and in Manchester, Glasgow, Edinburgh, and other large towns. It contains much information useful to the mechanic, engineer, decorator, and manufacturer. Messrs. WEBBS & Co., horticultural engineers, King's Road, Chelsea, S.W., send a specimen of a strong leather pocket-book and almanack combined, well suited for rough usage;

and T. FLETCHER & Co., a block Calendar of the usual useful stamp.

"DICTIONNAIRE DE BOTANIQUE."—This splendid publication, edited by M. BAILLON, and published by HACHETTE, has nearly reached its termination, if we may judge from the circumstance that it now reaches *Zyzy*. Indexes and references to plates, we presume, are to follow. The coloured plates have been issued without reference to the sequence of the text, and without numbers, so that it will be difficult to cite them properly.

THE GARDENERS' ORPHAN FUND.—At a meeting of the Committee of the above, held on the 18th inst., Mr. WILLIAM MARSHALL presiding, the following special receipts were announced:—Proceeds of concert at Chiswick in aid of the fund, sent through the Gardeners' Mutual Improvement Society, £20; collected at the Leighton Buzzard Chrysanthemum Show, and forwarded by Mr. J. SMITH, Leighton Buzzard, £20 10s.; sale of flowers and fruit at the Edinburgh Chrysanthemum Show, per Mr. M. TOWN, £20; and proceeds of twelve money-boxes, collected in different parts, £18 15s. 6d. The Hon. Secretary, Mr. A. F. BARRON, reported that applications had been received from thirty candidates in view of the approaching election; the same were examined, and all being in accordance with the regulations, were passed for publication in the voting papers. It was resolved that January 4 be the last day upon which applications can be received, and the Committee will meet upon that day.

PLANTS OF CENTRAL ASIA.—Dr. KANITZ, the indefatigable director of the Botanic Garden at Kolozsvár (Klausenburg), Hungary, has published a list of the plants collected in the excursion of Count BÉLA SZÉCHENYI in Central Asia, &c. The title-page and preface are in Hungarian, but the descriptions of the plants are in Latin. Bibliographical indications and references to plates are given, whilst of the newly-described species full Latin descriptions are supplied, and in some cases excellent lithographic illustrations. Several new *Primulas* and *Gentians* are figured. *Gentiana Széchenyi*, with blue flowers lined and spotted with white, from Szechuan, is worthy of introduction to gardens.

LETTUCE AS A DRUG.—Most of us have heard of the reputation of Lettuce as a sleep producer. "For want of rest, Lettuce and Cowslip wine *probaturum est*." So little virtue, however, has the Lettuce in this particular, that the drug *lactucarium* has quite gone out of use. Latterly, however, Mr. DYMOND, working in the research laboratory of the Pharmaceutical Society, has succeeded in extracting from the wild Lettuce, as well as from various cultivated forms, an alkaloid having the power, like atropin in belladonna, of dilating the pupil of the eye. This alkaloid is identical with *hyoscyamin*, but occurs in such infinitesimal proportions that lettuce eaters need fear no ill consequences. The occurrence of a principle formerly supposed to be peculiar to the *Solanaceæ* among the *Compositæ* is noteworthy.

STOCK-TAKING: NOVEMBER.—To those who carefully note the events of the day in the columns of their daily paper, and month by month note the figures under the above heading, the fact is very apparent that we—the great Free-Trade community—are "in touch" with every commercial nation under the sun. Rumours of war—market "manipulations"—are at once reflected in our Trade Returns; the sympathetic response is given by every factory throughout the land; and on the seas our sails increase or diminish in volume just as our markets are buoyant or depressed. This paragraph has been well "in evidence" during the past twelve months; its usual interest is not decreased to-day, when we record an increase of 15 per cent. in the imports, and a decrease of 12 per cent. in the exports—the former due to the large importation of Wheat, the latter to a falling off in the exports of iron and iron manufactures to the United States, concerning which,

more anon. The following figures are extracted from the "summary" of imports for the month of November:—

	1890.	1891.	Difference.
	£.	£.	£.
Total value for month	£37,152,273	£43,861,349	+6,709,116
§II.—(A.) Articles of food and drink—duty free	11,224,898	15,302,756	+4,077,858
(B.)—do., dutiable	2,786,491	2,619,209	-167,282
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)... ..	9,495,050	10,968,564	+1,473,514
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,536,514	3,184,150	-352,364
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,332,415	1,944,693	+612,278
(B.)—Parcel Post ...	42,126	39,214	-2,912

This much being "recorded," we may now with advantage devote a few lines to the McKinley Tariff. A few months since, President HARRISON gave directions for "taking stock" of the outcome of the latest thing in bad statesmanship—a little preliminary fanfare being performed on the Government trumpet; and the inquiries were instituted. The results are now to hand—there are no more trumpets! On receipt of the news respecting the Presidential movements on the Excise lines, we communicated with some folks in New York and Washington, who, experience had long before taught us, knew something of such matters. The response, based upon accurate information and a keen outlook, was somewhat startling, and would have been given in this column last month; delay has not reduced the importance of the Exchequer returns now published in the Government journals, and which we summarise as follows, to wit, that the serious effect of the McKinley Tariff upon the Custom's revenue is shown by the fact that, during the five months the Tariff has been in full force, the period between July 1 (when the tin-plate duty went into effect) till the end of November, compared with the same months last year, the Customs revenue has fallen off over 26,000,000 dols., or at the rate of about 87,000,000 dols.—say, £17,400,000—annually. The total receipts of the Treasury are stated to be 40,000,000 dols.—or £8,000,000—less than in the corresponding period last year. If this rate of diminution be maintained, the total loss for the year will, it is stated, exceed 94,000,000 dols.—£18,800,000. A few hours previous to the arrival of these figures in London, our Board of Trade had published some very interesting statements as to the share of the workmen in this country in the money cost of articles produced in the various industries—we recommend the publication in the United States of a corresponding series of tabulated statements—to be followed by Canada and all other interested and protectionist countries! The following figures respecting the imports of fruits and vegetables are extracted from the general mass of returns for November:—

	1890.	1891.	Difference
§ II. Fruit:—			
Apples, raw bush.	600,618	950,011	+349,393
Unenumerated, raw	341,833	134,762	-207,071
Onions	498,849	581,003	+82,154
Potatoes cwt.	51,779	79,032	+27,253
Vegetables, raw, unenumerated value	£19,757	55,896	+36,139

It appears that we have during the past week or two been receiving large quantities of Tomatoes from the Canary Islands, together with large consignments of Cranberries from America—pity the latter did not arrive in time to "jam" them up with the Blackberry crop.

SHIRLEY HIBBERD MEMORIAL.—At a meeting of the committee appointed to carry out this scheme, held at Chiswick on November 17, 1891, Dr. MASTERS in the chair, it was announced that the sum received from all sources was £259 9s. 6d., and that after the payment of all expenses, amounting to £38 14s. 4d., there remained a balance in the bank of £220 15s. 2d. A satisfactory portrait of Mr. HIBBERD has been hung in the Lindley Library. The balance of the monies received is, after payment of the expenses of the deed, to be invested for the benefit of the orphan daughter in the names of Mr. W. R. HARGREAVE, Mr. LEONARD BARRON, and Mr. JOHN COLLINGRIDGE. The trust-deed is to contain provisions (1), that in the event of the death of the child, previous to her attaining her twelfth year, the amount then standing to the credit of the trustees shall be paid to the Gardeners' Orphan Fund; (2), that in the event of the decease of the child at any period between the twelfth and the twenty-first year of her age, then the monies invested shall become the absolute property of her uncle and guardian, Mr. C. M. MITCHELL.

HIMALAYAN JOURNALS.—We are delighted to have to announce the re-appearance of an old friend in the shape of a reprint of Sir JOSEPH HOOKER'S Himalayan Journal. It is now issued in one volume by Messrs. WARD, LOCK, BOWDEN & Co., with an introductory biographical note by the late Mr. BETANY. A book of this character is of perennial interest to the naturalist and to the geographer, whilst to the horticulturist it has a special value. Immense changes have occurred since the original publication of the book in 1854, but these changes have only enhanced the value of a book which should stand on the shelf with DARWIN'S *Journal of a Naturalist* in every garden library. Few more acceptable gifts could be made to a gardener than this delightful volume.

"THE LAW OF BANKRUPTCY."—Some of our readers are occasionally under the necessity, from some cause or another, of obtaining some knowledge of the law of bankruptcy. To such folk we may commend a little treatise by Mr. C. E. STEWART, and published by EFFINGHAM WILSON & Co., Royal Exchange, in the earnest hope that they will require no further practical insight into the subject.

PUBLICATIONS RECEIVED.—*How to Grow Onions*. By J. A. TAPLIN.—*Report of Proceedings of Fruit Conference, Manchester*.

PLANT PORTRAITS.

CAMPANULA PULLA, *Garden*, November 14.
LEPACHYS COLUMNARIS, *Meehan's Monthly*, November.—Yellow Composite, allied to *Rudbeckia*.
SENECIO HERITIERI.—A beautiful greenhouse plant, allied to *S. cruenta*, which is the origin of the cultivated *Cinerarias*. It is the *Cineraria lanata* of Lamarck. *Garden and Forest*, October 28.

HAZELWOOD, KINGS LANGLEY.

[SEE SUPPLEMENTARY ILLUSTRATION.]

LEAVING behind the ancient city of Verulam—the modernized St. Albans of Orchidic fame—with its renowned and picturesque-looking Abbey standing on a commanding eminence, where it has withstood the storms of nigh eight hundred years, passing along a narrow winding road for some seven miles or so, when the Hawthorns and Brambles were putting on their autumn tints, we reached at length Hazelwood, Kings Langley. This demesne, which consists of some five hundred acres, was once the property of Lord Rokeby, but now for several years has been the seat of Vice-Admiral Ralph P. Cator.

The time at my disposal allowed me to pay only a passing attention to the trees and shrubs, of which there is a very rich variety in the grounds at Hazelwood. It is little wonder that artists go into raptures over the colouring of the autumn landscape, and last season the depth and variety of tints innumerable seemed to be more conspicuous than usual—

perhaps because the sights of previous autumns have, with time, somewhat faded from my remembrance. At any rate, the red and brown foliage of the sturdy and goarled Oaks, and the deep purple, crimson, or mellow brown of the Beeches, with their tall, smooth trunks, formed a beautiful contrast to the deep green hues of the Deodars and Lebanon Cedars, Pines of various species, Abies, Araucarias, &c., with which they were intermingled. The common Virginian Creeper and Veitch's variety were likewise all aglow with various hues of crimson and purple-brown. Not so the beautiful *Magnolia glauca*, which seemed to care little for the

Fine shrubs abound, and good use is made of the columnar forms of Irish Yew, and of *Thuia* in variety.

The parterre depicted in the lower view consists chiefly of round-headed shrubs, contrasted with the columnar or pyramidal forms above-named which stand on turf. Amongst these blended with good taste are some few shrubs, flowering and others, which are allowed to grow in restrained negligence together with beds of herbaceous plants, Rose bushes, flowering climbing plants on poles and arches, clumps of Adam's Needle, &c. It will be remarked that plenty of gravelled space is allowed between the groups and

best species and varieties is to be found, which is in a clean and healthy condition. Although the houses have not been specially constructed for Orchids, having been built by Messrs. Wright & Holmes with curvilinear roofs, the glass fitted without putty, nevertheless the plants have thrived well. In the cool house was to be seen a fine display of *Odontoglossum crispum*, the flower scapes with from sixteen to eighteen flowers each; and the large golden-blotched *O. grande*. Among the *Dendrobium*s, the gigantic white-flowered *D. formosum* displayed its incomparable blooms in company with *D. Jamesianum* and *D. infundibulum*. The rare *Oncidium Larkianum*—a supposed natural hybrid between *O. crispum* and *O. Marshallianum*, had a fine flower spike. It is to be hoped that this fine species will become more abundant than it is at the present time. *Cypripedium*s are in strong force, most of the best species and hybrids being represented. Among *Dendrobium*s not mentioned above might be named *D. nobile* with its varieties, *Cooksoni*, *nobilis*, and *Sanderianum*, *D. Pierardi*, *Wardianum*, *Falconeri*, a fine batch of *MacCarthyi*, and a few of the so-called Elephant Moth *Dendrobium*, *D. Phalaenopsis Schroderianum*, which has lately created such a sensation. *Cattleya*s were well to the front, and among the usual kinds were several pieces labelled *Warocqueana* and *labiata autumnalis vera*, which, I presume, may now be considered as synonymous from a botanical point of view. *Aerides*, *Angraecum*, *Phalaenopsis*, *Laelia*, *Celoglyna*, *Sophrontis*, *Sobralia*, *Zygopetalum*, *Miltonia*, *Lycastes*, *Calanthe*, *Brassia*, and several other minor genera, all find a place, and altogether they make a choice and valuable collection. J. W.

FIG. 111.—A NOVEL HEATING APPARATUS.

AN IMPROVED METHOD OF, AND APPARATUS FOR, HEATING.

In this apparatus a generator of suitable design and dimensions is provided with an air chamber, or with air chambers, and with a boiler fitted with tubes for generating heat—the boiler being supplied with water by a suitably-placed cistern—and pipes or other appliances are attached thereto as required for circulating, distributing, and using the heat generated.

The air chambers and the system of pipes have free communication with the atmosphere by apertures in the under-surface of the pipes, which provide for the circulation, expansion, and contraction of the hot air and vapour, convey the condensed water to the boiler, and maintain an equal pressure between the atmosphere outside the apparatus and the current of heat circulating therein.

The arrows in the generator indicate the rise of vapour from the boiler, the hot current of waste heat from the gas flame, and the hot air current in the air chamber. The heat and vapour unite and form the moist circulating current.

The arrows in the pipes show the direction of the flow, and the current of non-radiated heat returning to the air chamber.

In small apparatus, the fuel may be gas or mineral oil, and the waste heat may be passed through the pipes to find its exit through the small pipe *a'*, covering the aperture for expansion, which is carried to the outside air.

For large apparatus, breeze, coke, or coal, can be used, and the quantity of fuel required will be little more than a third of the amount consumed by hotwater apparatus of equal size.

The generator can be substituted for the boiler of existing hotwater apparatus, and the water in the pipes dispensed with, thereby saving the fuel required to heat it. H. Stevenson. [We hope soon to be enabled to see the above apparatus at work, and to give our readers the results of an actual trial. In any case, we have here a radical change from the usual modes of heating, and obtain heat direct from its source without the intervention of a large body of water which is always a source of expense. We are informed that any required degree of heat is

dulness of the season, and several of whose large white flowers peeped out here and there between the glossy bright green leaves. One of the arbours in the garden looked particularly gay, encircled by a Vine from Balaclava, planted by Lord Rokeby. The other interesting objects to be seen outside were numerous, some of which, however, must be included in my notes of the place, as they are nicely delineated in the views given in this week's Supplement of the *Gardeners' Chronicle*.

As will be seen in the upper view, the dwelling occupies the higher of the two terraces; and the views from the path by the house, and the windows extend over much of the garden in front and the immediate landscape in that direction. Each terrace is furnished with a broad path and flights of steps.

beds in one part of this pretty garden, thus affording not only comfortable access to them in rainy weather, but a good contrast of colour, better indeed than that afforded by the turf. There is much in this garden that we hear sometimes deprecatingly termed old-fashioned, but which is none the less a source of pleasure to the owner and beholder for all that.

Chrysanthemums were, at the time of our visit, in their full glow of beauty, and fine specimens of *Soleil Levant*, *Lord Beaconsfield*, *George Atkinson*, *La Triomphante*, and others, were observed in one of the houses. Other houses were stocked with the usual stove plants, and Nectarine and Peach trees.

The Orchids.—Eighteen months ago these plants hardly existed at Hazelwood, but now it is no exaggeration to say that a very fine collection of the

obtainable with this apparatus, and that it is far easier of management than any hotwater apparatus heated with coal, coke, or breeze. It is particularly suitable for small houses, where the length of piping required does not exceed 100 or 200 feet. In some of its principles it has a resemblance to the Polmaise system—is, indeed, an application of those principles, but without their drawbacks. Ed.]

NOTICES OF BOOKS.

THE PLANT-WORLD, ETC. By George Masee. Small 8vo, 212 pp. Whittaker & Co.

"The idea of this little book is to furnish an introduction to the study of botany from the standpoint of considering plants as living organisms, subject to all the varied vicissitudes that are more generally recognised as influencing animal life."

With these words, Mr. Masee introduces his little volume. The headings of the chapters will of themselves serve to show how he has carried out his idea—they are as follow:—1, Plant Architecture; 2, Chemistry and Physics of Plant-life; 3, Protective Arrangements; 4, Reproduction; 5, Relationship among Plants; 6, Fossil Plants; 7, Geographical Distribution of Plants. The chapter, "Plant-Architecture," might as well have been termed plant-construction, for it deals more particularly with the substances and materials out of which plants are made than with their architectural or morphological arrangement. But this is a detail of no particular moment. It is sufficient to say that Mr. Masee has well carried out his programme, and that his book is well suited for those who desire to obtain, without any great expenditure of time or pains, a general idea of plant-life, and of the principal questions which interest modern-time botanists.

FOSSIL BOTANY. By H. Graf zu Solms Laubach. Authorised English translation, by Henry E. F. Garnsey. Revised by Isaac Bayley Balfour. (Oxford, Clarendon Press.)

This is another of those useful books for which we have to thank Mr. Garnsey, Professor Balfour, and the Oxford Press. The basis of the work consists of notes of lectures originally delivered in the University of Gottingen, and in its preparation the author acknowledges the great assistance he has received from Dr. Williamson of Manchester; Mr. Carruthers, Mr. Woodward, as well as to M. Renault, of Paris. Free access has also been granted to the collectors of Goppert. The first chapter is devoted to a consideration of the manner in which plants become fossilised. The author then proceeds systematically to describe the fossil forms referable to the lower Cryptogams, Coniferae, Cycadaceae, Cordaites, Ferns, Equiseta, Lycopodites, Lepidodendra, Sigillariae, Stigmariæ, Calamariæ, Sphenophyllæ, and various miscellaneous groups or little-known assemblages of doubtful character. The higher-flowering plants are omitted. The whole subject is treated from the standpoint of the systematic botanist, which is in many cases different, at any rate in degree, from that of the professed geologist. The latter often acts on the assumption that more is known of the structure and affinities of certain forms than the botanist is willing to admit. The geologist hardly lays sufficient stress on the great changes of form and appearance which often characterise different stages of growth of one and the same plant. If botanists are led astray by such periodic forms of living plants, as they often are when they are seen isolated, it is not to be wondered at that the geologist, whose material is generally so much more imperfect, and so much more difficult to analyse, should fall into similar error; indeed, we suspect our geological friends will view with surprise the hesitating manner in which, in some cases, Count Solms expresses his opinions. His fellow-botanists, on the other hand, will admire this cautious handling of doubtful subjects, as much more likely to conduce to the ultimate establishment

of the truth than any dogmatic assertion on imperfect evidence would do. Geologists must bear in mind the great imperfection of their records, and the almost absolute certainty that many forms once existed of which no traces now exist. Such extinct forms must have furnished many links between pre-existing and actual vegetation. The account of the Cordaites here given is particularly interesting, as showing the relation of these plants to the Conifers. The pollen-cells, with their male prothallus unusually developed, are specially interesting. The subject-matter of the work is not of such a nature to justify any lengthened critical appreciation in these pages. We can only indicate the general nature of its contents, and commend their perusal to the student as within its limits the best general account of fossil plants that has yet appeared in this country. A few illustrations are given. It is to be regretted that many more were not forthcoming. The copious references to the literature will be of great service to the student, to whom also the ample index will be a great boon. The "get up" of the volume reflects credit on the Oxford Press, who have once again laid the botanists of this country under heavy obligations.

HOME CORRESPONDENCE.

GARDENERS' ORPHAN FUND: A SUGGESTION.—In the "Rules and Regulations" of this excellent charity, under "Objects," I read the following:—"The objects of the Fund shall be to make allowances or grants of money (in accordance with Rules B and H), to aid in the maintenance of the Orphans of Gardeners, Foremen in Public, Private, and Market Gardens, and the Managers or Departmental Foremen in Nursery and Seed Establishments." It seems to me that this particular rule wants amplification, in order to give a wider scope in the benefits conferred, and enlist the heartier sympathies of those who are now practically outsiders, but yet who may be, are indeed, supporters of the Fund. 1. As the rule at present stands, I take it, that the orphan of a journeyman gardener would not be eligible to participate in the benefits of the Fund, the word gardeners being used. As generally understood, this means, of course, head gardeners. 2. The fund now makes appeal, and rightly so, to a pretty wide constituency in the horticultural world—may such appeals be always nobly answered!—and the more comprehensive it can be in the distribution of its benefits (where needed) amongst the orphans of those connected, directly or indirectly, with the "gentle art," the wider, assuredly, will its popularity and usefulness be. The annual meeting is approaching, a fitting time at which to discuss such matters, when, possibly, these hints, which are well meant, and thrown out in the real interests of the Fund, may receive any attention they may deserve. J. B.

DR. HOGG PEACH.—In reply to Mr. Blayney, page 742, I very much doubt if he has got this variety true to name, as it is not usually guilty of such tricks as he describes; but, on the contrary, I have always found it one of the easiest Peaches to grow, and a very sure cropper—and it flowers most abundantly, the flowers being of the largest size and of a deep pink colour. The fruits colour up well if not shaded by the leaves, but the flavour and size of the fruits are not first-rate when compared with other varieties, and I have discontinued growing it for this reason. Your correspondent gives sure evidence that his treatment is right from the fact that he has grown Noblesse satisfactorily by the side of the offending variety. I should, if possible, discard the Dr. Hogg whether it be true to name or not, and plant either Crimson Galande, Prince of Wales, or Stirling Castle, in its place—and preferably the first of the three. If he cannot do this, he should lift the unsatisfactory tree as soon as possible, cut off any perpendicular roots and suckers, ensure perfect drainage, afford fresh soil if necessary, but without any admixture of manure, and take especial care that it is not deficient in lime, and not too adhesive. Peaches like a retentive soil, but it must not be of a binding nature; burnt earth, charred rubbish, and mortar rubbish are all valuable as antidotes to retentiveness. It does Peach trees much good to lift them every few years, even after they attain their full size, and if this be carefully done, no damage will occur to the ensuing season's crop,

unless by chance the fruit is a trifle smaller than usual; young Peach trees often fail to fruit satisfactorily under glass, or the fruit does not attain its full size, through making too strong a growth the previous season; to prevent this, they should always be planted in poor soil, and not grown in a close atmosphere. It is an easy matter to feed the trees in after years, when they have heavy crops, and show by the general character of their growth that they require assistance. *W. H. Divers, Kelton Hall Gardens, Stamford.*

PRIMULA NIVALIS.—I thank Mr. Wolley Dod for the instruction he gave me at p. 708 of the *Gardeners' Chronicle*, in reference to the above plant. I may now have an opportunity of seeing the plant, and if it be not so ornamental as *P. denticulata* and some others, I have no doubt it is botanically interesting, as is the whole genus. *W. Withers.*

PROTECTING PARSLEY.—We tried three ways of doing this last winter with unexpectedly varied results. Preparations were first begun in the previous March by sowing two rows of Veitch's Selected on a narrow border by the side of a wall; this grew vigorously, and in November looked all that could be desired. When frost commenced, it was protected by straw burlles placed against the wall in a sloping position. In ordinary winters we had always found this plan to answer well, but the exceptionally severe frost of last winter killed every leaf on the plants, and they were late in making a fresh start. Another lot of the same seed was sown at the same time in a square patch under the shelter of some tall trees, where it would be convenient to cover the plants with a frame; and when the severe frost came the frame and some thatched hurdles were put over it, the result was much the same as in the first instance. The third batch was sown near to the last-mentioned lot, in rows by the side of a walk, at the same time as the others, and did well also during the summer; in fact it looked too good to lose, although we did not intend to protect it at the time of sowing. Accordingly, a small quantity of dried bracken was placed over it, just enough to cover it. We were very glad after a few weeks that this had been done, as it was the only Parsley we had which survived the winter, and it plainly showed us that bracken is the best protector for this and similar purposes. *W. H. Divers, Kelton Hall, Stamford.*

ROCKERIES.—I fear that "H. E." and I are like two persons in a room, one window of which faces north and the other south. "H. E." looks through the south window and talks about what he sees, while I look through the north window and talk about what I see. Though I have not had time to make out the inquiry suggested by "H. E." of the Gentianella, the Violet, the Horse Chestnut bud, I will, in deference to him, so far modify my previous statement as to say many plants are lost through over-nursing. I will add, too, that giving the plant too much earth is a form of over-nursing not unknown to me. Doubtless there is, as "H. E." says, "coddling" and "coddling," and I can assure him that I should so far coddle such plants as I know to demand it, under ledges and in little nooks where they will get the shelter they require. But I fail to see that "H. E." has proved that the rockery system advocated by me is wrong, because Mr. Allen has sent his Snowdrops to Ryde to be saved from the ill to which they are heirs in Somersetshire. Whilst giving its full force to "H. E.'s" wide and well deserved reputation as a gardener—and nobody wishes to detract from it less than I do—I might ask whether the Isle of Wight has no reputation of its own for climate? I must say, too, that my method is no more "happy-go-lucky," no more "free-and-easy" than "H. E.'s," though I contend that my rockery will look better in winter than his alpinery, and in summer will look as well. I daresay he may at Ryde save the lives of *Myosotium nobile* and an *Opuntia* or two, which we in the North should not plant upon a rockery, except under very exceptional conditions (although either of the above-named plants will survive 18° to 20° of frost). He may also save the lives of "many other things," but as he does not name them, I cannot give an opinion. "No man can do any more than his best," as "H. E." very truly remarks; and that—though no match for "H. E." with the pen, nor for his F.R.S. visitor in wisdom—I must continue to do for my rockery system, while "H. E." devotes himself, I trust, with ever-increasing success to his alpinery. *W. A. C.*

CELERY, WRIGHT'S GROVE PINK.—I note some of our leading exhibitors of vegetables depend upon

this variety exclusively as a red Celery, so highly do they think of it. It grows large, blanches readily, does not run to seed quickly, and is, moreover, of excellent quality; indeed, by some it is regarded as quite the best for that purpose, and no doubt it is for general use. S.

WINTER NELIS PEAR.—I forward a few fruits of the above variety grown on walls here. I have taken some pains to get size into the fruit, as you will observe. The fruit sent is fairly well grown, and it is well known to be small under the usual management. We have a few trained trees planted on different aspects to prolong the season of ripening, and we had the fruits in daily use last year for a period of six weeks, and are likely to have it for a longer one this year. This Pear requires high cultivation, also to have the bloom buds thinned out considerably, and the fruit likewise, as it is liable to set its fruit in bunches. It is one of the varieties that I recommend to be planted upon tiles in flat districts and where the soil is inclined to be heavy or stiff. It is an excellent Pear when well grown, of good flavour, ripens at a season when it is of great value. *Robert Smith, Yalding, Kent.*

LAW NOTES.

In the High Court of Justice, Chancery Division, on Thursday, December 17 (before Mr. Justice Kekewich), *Sir Henry Bruce Menx, Bart., v. Cudley*. The trial of this action raised a question of some interest upon the Agricultural Holdings Act, 1883. The object of the action was, in substance, to prevent the defendant, who was lessee of a farm under the plaintiff, from converting it into a market garden by erecting thereon glasshouses for the cultivation of Tomatos, Grapes, Mushrooms, and other market produce of that character. By a lease, dated the 21st of January, 1889, the plaintiff, Sir H. B. Menx, demised to the defendant the Bulls-Cross Farm, in Cheshunt and Enfield, in the counties of Hertford and Middlesex, adjoining the plaintiff's mansion, Theobald's Park, and consisting of arable and pasture land, together with the messuages and farm buildings thereon, comprising about 152 acres, at a rent of £225, rights of sporting being expressly reserved to the lessor, and the lease contained a covenant by the defendant that he would in all respects cultivate and manage the farm and every part thereof "in a good, proper, and husbandlike manner according to the best rules of husbandry practised in the neighbourhood," and would at all times use his and their utmost endeavours to preserve the game on the demised premises and the nests and eggs of all partridges and pheasants. The plaintiff's complaint was that, without his consent, the defendant, in 1889, erected on the "arable" land of the farm two glasshouses for the cultivation of Tomatos and other hot-house produce for the London market, and that in 1890 he erected a third glass-house, in spite of the remonstrances of the plaintiff's bailiff; also that he was intending to erect additional houses. The plaintiff contended that the erection of glass-houses for the purposes aforesaid constituted such a change in the mode of cultivation stipulated for by the lease as to amount to a breach of covenant, and that the conversion of the farm into a market garden was "waste" on the defendant's part, and would cause loss to, and impose additional burden on, the plaintiff. The plaintiff accordingly claimed an injunction to restrain the defendant from committing the acts complained of. The defendant contended that he had the right to erect glasshouses on the land, and that the same constituted an improvement to the farm and the inheritance thereof. He also pleaded acquiescence or consent on the part of the plaintiff. He also contended that the erection of the houses was authorized by the Agricultural Holdings Act, 1883, and that they were buildings which, having regard to the provisions of that Act, might be removed by the tenant at the expiration of his tenancy, or might be bought by the landlord.

The only questions his Lordship had to consider were first, whether what the defendant was doing was within the terms of the lease; and, secondly, whether, irrespective of the terms of the lease, it was "waste" according to the common law. A subordinate question coming under the first head was whether the plaintiff had consented to what had been done. Upon the evidence on that point, his Lordship came to the conclusion that the plaintiff has either personally or by his agents consented to the erection of two of the houses. As to the third house, there was some difficulty. His Lordship's impression was that there had been no positive consent on the plaintiff's part to the erection of that house; but that question was really immaterial, because, even if the defendant had obtained the consent, it would still be necessary to consider whether he could erect a fourth house. Now, his Lordship came to the lease, and upon that there was a point of real importance—namely, whether under a lease of what was called "agricultural land," the tenant was entitled to put up glasshouses for the cultivation of non-agricultural produce, such as Tomatos, Grapes, and the like. It was to be observed that, although this was a lease of a farm—that is to say, an agricultural lease—there was no prohibitive covenant against the lessee's doing things of this kind, and also no provision for a rotation of crops. Therefore, the lessee was left at large to cultivate the land at his discretion, the only restriction on that discretion being that he was to cultivate "in a proper and husbandlike manner, according to the best rules of husbandry practised in the neighbourhood;" and he was also bound at the end of the term to yield up in good condition not only the existing buildings, but all fixtures and other things attached to or set up on any part of the demised premises. So that the lease contemplated certain additions in the way of fixtures. Also it was to be observed that anything of this kind done was to be done at the tenant's risk. He could not compel the landlord to take it or pay for it, so that, after spending perhaps hundreds of pounds on the property, the tenant might be compelled to go out of possession without having got anything but a poor return for his expenditure, and possibly without getting anything back. This was so if the Agricultural Holdings Act, 1883, applied, except as to buildings, erected with the landlord's consent. Now, what was the tenant here doing which was not "according to the best rules of husbandry practised in the neighbourhood"? One must bear in mind the change of circumstances in the neighbourhood, and the mode of cultivation of land now adopted there. One must look and see what was going on in the neighbourhood and not exclude the consideration which came within one's own extra-judicial knowledge that the wants of the metropolis and the neighbourhood were constantly extending and necessitated the increase of market gardens. Then there was the consideration that in the neighbourhood of this farm there were other market gardens, and also other farms conducted on the principles which the defendant had adopted to his own advantage—namely, combining the farm proper with the market garden proper. His Lordship could not see that this was not using the land according to the best rules of husbandry practised in the neighbourhood. Construing the case according to the usages of mankind and the words of the lease, he saw no reason why the defendant should not erect such glasshouses as he thought fit. His Lordship was of opinion that the defendant was entitled to use the ground as a market garden, and, if so, he was entitled to cover it with glasshouses, and derive advantage from it in that way. Then was there any injury to the inheritance? The evidence showed that to be an absurdity; and that, so far from the erection of these houses being an injury to the inheritance, it would be an advantage to the farm, the ground being in the neighbourhood of London. The only other point was as to the application of the Agricultural Holdings Act, 1883. In the view his Lordship took of the case, it was unnecessary to consider what the meaning of the Act was; but the

Act appeared to go a long way towards getting rid of the old common-law doctrine of waste, and to be quite consistent with the two authorities above referred to. His Lordship felt inclined to hold that these houses were "improvements" within the Act—that is to say, improvements for which the tenant could get compensation; but he did not think it necessary to go further than that. His Lordship could not find a single point on which the plaintiff succeeded, and therefore there must be judgment for the defendant with costs. *Condensed from the "Times."*

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

DECEMBER 21.—A meeting of the committee took place at Anderson's Hotel, Fleet Street, on the above date, Mr. E. C. Jukes presiding. Mr. R. Ballantine reported as to an interview he and the Secretary had recently with the Chairman and Secretary of the Royal Aquarium as to the exhibitions to take place there in 1892, with the result that the resolution passed at the last meeting, that the show in November next be limited to two days, was rescinded, and it was resolved, that in accordance with the request of the authorities of the Royal Aquarium, it be extended to three days, viz. Tuesday, Wednesday, and Thursday, November 8, 9, and 10. The two other exhibitions will be in September and October, the dates to be suggested by the Schedule Revision Subcommittee. Letters from various exhibitors bearing upon the revision of the schedule and other matters were referred to this committee.

An objection raised at the Batley (Yorkshire) Chrysanthemum Show, to the presence of Amy Faize in a class for six reflexed blooms, on the ground that it is a Japanese reflexed, was upheld by the committee after some discussion.

The secretary announced contributions to the special prize fund, including £6 from Messrs. H. Cannell & Sons, bringing the same up to £35. Seven new members were elected, including two fellows. A vote of thanks to the chairman closed the proceedings.

Obituary.

MR. W. ALFRED DICKSON.—We regret to have to record the death of Mr. William Alfred Dickson, which took place at his residence at Newton Villa, Chester, shortly after seven o'clock on Thursday morning, Dec. 17. Mr. Alfred Dickson was 54 years of age at the time of his death. He had the entire management of the nurseries during the whole period of his active business life. As a nurseryman, very few men living had such knowledge of trees and plants in relation to their history, their treatment, cultivation, and commercial value. The perpetual acquirement of knowledge in this wide and interesting field was aided by a memory of marvellous retentiveness, and a mental grasp crisp, clear, and in every way remarkable. He had that quick discernment which enabled him to pick up a point which gave a characteristic distinctiveness and a determining feature to a particular plant, and which once seen seemed never to be forgotten. If his love for plants did not lead him into the extravagant excesses which often mark the enthusiast, it was simply because his business brought him into close contact with the economical properties of flowers and shrubs and trees. Yet the tender regard he had for plants and flowers was manifested often to those who might be brought into contact with him at his offices in the nursery grounds. At such times when his attention would be given to some new variety which was shortly to add to the riches of horticulture, and with the introduction of which he was closely identified, one would find on his table, in front of him and about him, now a Daffodil, now a Rose, now a Carnation, or something of bright beauty, depending upon the season of the year when the call might happen to be made. This was placed so that it seemed to be more of a companion than a specimen to be critically examined for comment, for nomenclature, or for description. In this particular direction many of the newly

introduced plants owe their distinctive title to the perceptive and mental endowment of Mr. Alfred Dickson. As an employer he was firm, without that sternness which seems inevitable to some men when brought into contact with the problems and trials involved in the employment of labour, and in dealing with large masses of men. He was a strict observer of method and punctual discharge of duty. When he passed the word he expected the accomplishment of duty, and he was not slow to discern how far those about him could be trusted to carry out his instructions.

MR. JOHN VERT.—We regret to announce the death on December 1, at Norley, Frodsham, Cheshire, of Mr. John Vert, who had been gardener and bailiff to the Hon. A. and Mrs. Lascelles, for a period of fifty-two years. The deceased, who was an excellent cultivator, was the father of Mr. James Vert, gardener to Lord Braybrooke, Audley End, Saffron Walden.

VARIORUM.

WOES OF THE CATALOGUE MAN.—A reader sends us the letter that appears below, and writes:—"Pity the poor fellow who has customers like this to satisfy."

"Oct the 30 1891 Deare Sir I rite you a few lines to get yure Price one a few Plants, all redy Rooted What you price will be on these, if you are not too deare. I Will send for moore, and I can get you good menny orders for yure plants heare. they all say they will wait and see mine first. I Will rite What kind I want and I want you to tell me what they will cost me. I want you to let me have them as cheap as you can and if they are not to huy I will send for moore and get you all the orders that I can.

rite at once and let me no what you can do these are What I want now one Dabble Red tea Rose one Dubble yellow tea Rose one Dabble Red fusa to of the best wax Plants that you have got ones that has Dubble flowers an to colars of these to best lilies to colours Dubble if you have I want them that has the largest flowers. I don't want the small kind of Plants, if you do rite buy me I will buy you." The American Florist.

MARKETS.

COVENT GARDEN, December 23.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal sale-men, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

No alteration in prices; business somewhat brisker. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Kent Cobs, Lemons, Pine-apples, etc.) and their prices per unit.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Adiantums, Aralias, Aspidistra, etc.) and their prices per dozen or per pot.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Acacia or Mimosa, French, Azalea, etc.) and their prices per bunch or dozen.

ORCHID-BLOOM in variety.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Artichokes, Beans, Beet, Carrots, etc.) and their prices per bunch or dozen.

POTATOS.

Christmas trade has affected prices but little, arrivals keeping pace with increased demand. There is still a demand for good quality, but samples of the best are few. Best, 95s. to 100s.; medium, 65s. to 70s.; common, 50s. to 60s. J. B. Thomas.

FRUITS AND VEGETABLES.

BOROUGH: Dec. 22.—Demand moderate at quotations:—Savoys, 1s. to 5s.; Broccoli, 7s. 6d. to 10s. per tally; Spinach, 2s. 6d. to 3s. per bushel; Turnips, 1s. 6d. to 1s. 9d.; Carrots, 1s. to 1s. 9d. per dozen bunches; English Onions, 5s. 6d. to 6s. per cwt.; English Apples, 2s. 6d. to 6s. per bushel; Canadian Apples, 15s. to 15s. per barrel; Newtown Pippins, 15s. to 25s. do.

SPITALFIELDS: Dec. 22.—Ample supplies, but a bad demand. Quotations:—English Apples, 2s. 6d. to 6s. per bushel; American do., 10s. to 16s. 6d. per barrel; Pears, 1s. 6d. to 2s. per half-sieve; English Tomatoes, 4s. to 5s. 6d. per peck; foreign do., 1s. to 1s. 6d.; Cabbages, 2s. to 3s.; Savoys, 3s. to 3s. 6d.; Cauliflowers, 6s. to 10s. per tally; Greens, 2s. 6d. to 4s.; Turnips, 2s. 3d. to 3s.; Carrots, 1s. to 2s. 6d.; Parsley, 2s. 6d. to 4s. 6d. per dozen bunches; Spinach, 1s. 6d. to 2s. 9d. per bushel; Parsnips, 1l. to 8l. per score; Endive, 1s. to 1s. 6d.; Cabbage Lettuces, 4d. to 8d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 5s. to 5s. 6d. per cwt.; Bordeaux do., 4s. to 4s. 6d.; Spanish do., 6s. to 7s. per case; Belgian do., 3s. 9d. to 4s. 9d.; Patch do., 3s. 9d. to 5s. per bag of 110 lb.; Celery, 6d. to 1s.; Horseradish, 1s. to 1s. 2d. per bundle.

STRATFORD: Dec. 21.—There was an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Savoys, 3s. to 6s. per tally; Greens, 1s. 6d. to 2s. 6d. per dozen bunches; do., 7s. to 12s. per tally; Cauliflowers, 1s. to 3s. per dozen; do., 5s. to 12s. 6d. per tally; Turnips, 2s. to 2s. 3d. per dozen bunches; do., 36s. to 50s. per ton; Carrots, household, 32s. to 45s. do; do., cattle-feeding, 28s. to 32s. do.; Parsnips, 9d. to 1s. per score; Mangels, 16s. to 20s. per ton; Swedes, 16s. to 20s. do.; Onions, English, 110s. to 130s. do.; do., Dutch, 4s. to 4s. 9d. per bag; Apples, English, 2s. 6d. to 6s. per bushel; American, 15s. to 20s. per barrel; Brussels Sprouts, 1s. 6d. to 2s. per half-sieve; do., 2s. 6d. to 3s. per flat; Celery, 1s. to 1s. 3d. per roll.

POTATOS.

BOROUGH: Dec. 22.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 85s.; Bruce Magnums, 60s. to 90s. per ton.

SPITALFIELDS: Dec. 22.—Quotations:—Magnums, 55s. to 70s.; Regents, 55s. to 70s.; Champions, 50s. to 60s.; Imperators, 60s. to 80s.; Hebrons, 60s. to 80s.; Bruce Magnums, 60s. to 80s.; Snowdrops, 60s. to 70s.; Main Crop, 70s. to 80s. per ton.

STRATFORD: Dec. 22.—Quotations:—Magnums, 60s. to 80s.; Hebrons, 60s. to 75s.; Imperators, 45s. to 85s.; Scotch Main Crop, 40s. to 100s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Dec. 19, and for the corresponding period in the previous year:—1891, Wheat, 36s. 10d.; Barley, 29s. 6d.; Oats, 21s. 4d. 1890, Wheat, 32s. 4d.; Barley, 28s. 8d.; Oats, 17s. 6d. Difference: Wheat, +4s. 6d.; Barley, +10d.; Oats, +3s. 10d.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; do., inferior, 45s. to 75s.; hay, best, 60s. to 92s.; do., inferior, 26s. to 50s.; and straw, 20s. to 40s. per load.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for Districts, Temperature (Accumulated), Rainfall, and Bright Sun. Rows list districts 1 through 12 with corresponding weather data.

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending December 19, is furnished from the Meteorological Office:—

"The weather continued mild, rainy, and unsettled, during the earlier part of the week, but subsequently became cold and dry in all districts, excepting the extreme west of Ireland and Scotland. Heavy snow fell at many of the Scotch stations on the 15th.

"The temperature was again rather high until the period drew towards its close, when it fell fast. The averages were consequently again in excess of the means generally; in 'Scotland, N.' and the 'Midland Counties,' however, it just equalled the normal, and in 'Scotland, E.' and 'England, N.E.' it was a little below. The highest of the maxima were registered on the 15th in England, and on irregular dates elsewhere, and ranged from 56° in 'Ireland, S.' to 49° in the north and east of Scotland. The lowest of the minima occurred during the middle part of the week in the north, and at the end in the

VIEWS IN THE GARDENS AT HAZELWOOD.

more southern districts, and ranged from 16° in 'Scotland, E.' and 18° in 'Scotland, N.' to between 20° and 26° in the other parts of Great Britain, and to 32° in 'Ireland, N.' and the Channel Islands.

"The rainfall slightly exceeded the mean in 'England, E.' and 'Scotland, W.', but elsewhere it either equalled or was less than the normal quantity.

"The bright sunshine exceeded the mean in most of the southern and eastern districts, but shows a deficit in the west. The percentage of the possible duration ranged from 6 in 'Scotland, N.' and from between 9 and 16 in most of the western and northern districts to 34 in 'England, S.' and to 54 in the Channel Islands."

NOTICES TO CORRESPONDENTS.

COIL BOILER: *Invicta*. Apply to any of the large dealers in boilers. See our advertisement pages.

DENDROBIUM LEAVES SPOTTED: *J. J.* The plant has been kept too warm and close after its growth was finished.

IMPATIENS HOOKERI: In reference to the flowering of this plant, as mentioned on p. 739 of last week's issue, I regret that I should have written my note without having ascertained if the plant flowered at Kew, as I now learn that it flowers here regularly every year, although, so far as I can remember, I do not happen to have noticed it. *N. E. Brown*.

NAMES OF FRUITS: *A. Brown*. Round Winter Non-such.—*A. W. H.* 1, 5, 6, quite rotten; 2, Beurré Clairgeau; 3, Beurré Bachelier; 4, Glout Morçau.—*C. Lazenby*, 1, much decayed, probably Colmar d'Atenaberg; 2, Beurré Bachelier.

NAMES OF PLANTS: *A. W.* 1, *Cypripedium insigne*; 2, *C. venustum*; 3, *C. javanicum*, probably; 4, *Lælia anceps*.—*A. W. C.* Varieties of *Zygopetalum Mackayi*.—*A. W.* *Pol-monium corulea variegata*.—*P. A.* 1, *Abies Nordmanniana*; 3, *A. grandis*; 3, *A. nobilis*. Pinsapo is a true Silver Fir (*Abies*).

PEACH TREES IN POTS: *Royal George*. The trees are as easy to prune as a gooseberry bush, only the main branches ought to be kept wider apart, owing to the greater size of the foliage. Reserve as much of the past season's wood as has plenty of fruit buds on it, to afford you a chance of a good crop and some to spare. Let the wood be distributed all over the crown as much as may be, cutting the shoots to various lengths, with the view of presenting a uniform round shape to the crown. Cut away the shoots which have borne fruit the past season, leaving a shoot at the base of each shortened back to 6 inches, 1 foot, or 1½ feet, as may appear desirable, and never cut a season's shoot but to a wood bud, or it will die back to one in early summer. Get *The Miniature Fruit Garden*, by T. & T. F. Rivers, sawbridge-worth.

PELARGONIUM SEEDLING: *W. C. R.* Very pretty and distinct so far as we can judge.

SPICE IN ANCHOVIES: *J. R. J.* The sample of "spice" from the keg of so-called Norwegian Anchovies is a very mixed substance. There are traces, more or less, of black Pepper, Juniper berries, Ginger, Majoram, and perhaps several other things, but broken up so small as to be scarcely identifiable.

THE SEED TRADE: *Americanus*. It is found in practice impossible to give other than an approximate range of prices as a guide to values in the cases of Clovers, &c., in reports of seed markets. The range of qualities in each of the leading articles is very great. Red Clover, which on the 14th was quoted on Mark Lane at from 48s. to 60s. per cwt., is now quoted at from 30s. to 90s., according to quality. Alsike, from 40s. to 100s. White Clover, which on the 14th ranged from 48s. to 84s., is now quoted at from 30s. to 100s. It is impossible, therefore, that value can be fixed with such a marked difference in qualities—very much more than in the cases of fruit and vegetables.

WINTER and SPRING PRUNING,
TRIMMING, and THINNING OUT can be better and quicker done by the STANDARD MANUFACTURING COMPANY'S Celebrated TOOLS, including the "STANDARD" and "GIANT" TREE PRUNERS, the "MYTICUTTAH," and other useful appliances, than by any means. They were shown in actual use at the recent Horticultural Exhibition, Crystal Palace, and at the great Agricultural Shows at Bath and Doncaster; thousands of visitors being astonished at their wonderful power and scientific efficiency, coupled with great saving of time and labour, and the risk to life and limb reduced. After Stormy Weather, these Tools will be found invaluable for cutting off fractured branches, leaving the ends severed in a vital condition.
Sold by the principal Ironmongers and Seedsmen, the leading Stoves, and kindred Trades throughout the world, of whom Illustrated CATALOGUES may be had; or of the PATENTIFES and MAKERS, at their works and depot, ST. ALKMUND'S CHURCHYARD, DERBY.

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION. — *Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

ONIONS: How to Grow Them. Revised Edition, by J. A. TAPLIN, Banbury, Oxon. Price 6d. London: HOULSTON AND SONS, Paternoster Buildings; may also be had of the Author.

CHRYSANTHEMUMS,

And How to Grow Them. By C. E. SHEA, Esq.

A Practical and Scientific Treatise, that will be of great service, both to the oldest and most successful exhibitor and the youngest grower of the Autumn Queen. Mr. Shea has, by the treatment explained in his treatise, had a long series of triumphs, to which this season he has added, in keen competition with our most noted growers, at the Kent County, Watford, and Crystal Palace, finishing with the difficult feat of 1st in the 48 Japanese, at the Royal Aquarium Show, Nov. 10. In addition to the above, a paper by Mr. H. Shoemith is included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world.

This valuable work is now ready, post free, seven stamps. H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham.

GARDENING APPOINTMENTS.

MR. WILLIAM LEANEY, for the last four years gardener to Mrs. W. WARDE, Newbridge House, Bath, as Head Gardener to F. J. KINGFORD, Esq., Lacock, Chippenham.

MR. GREATORIX, Mytton Hall, Shrewsbury, informs the numerous Applicants for his Gardener's Situation, that the VACANCY IS FILLED.

WANTED, a SINGLE-HANDED GARDENER.—Must thoroughly understand Stove and Greenhouse Plants, Vines, Flower, Fruit, and Kitchen Gardening. Good Cottage.—H. E. KEARLEY, Woburnhurst Park, Aylesstone.

WANTED, an experienced MAN, to Grow Tomatoes, Cucumbers, Mushrooms, and Ferns; also Greenhouse Plants for Market. Well up in Cut Flower Trade.—H. MATTHEWS, Stockton Brook Nursery, Stanley, Stoke-on-Trent.

WANTED, a FOREMAN, thoroughly understanding Fruit (Inside and Out). An abstainer preferred. Age 26. Must have first-class references as to character and ability. Wages, 1s. per week. Bothy, &c.—Apply by letter only to HUGH SENESCALL, Walnut Gardens, Lydbury North, Shropshire.

WANTED, an UNDER FOREMAN, in the Fruit and Rose Department. Must be well up in Budding, Grafting, and Layering, and know Fruit Trees and Roses well.—Apply, stating wages required, to WILLIAM BARRON AND SON, Elvaston Nurseries, Borrowash, Derby.

WANTED, a good Garden LABOURER.—Not under 21; wages to commence at 14s. a week.—Address, Mr. LONG, Compton Gardens, Stockbridge, Hants.

Seed Trade.

WANTED, an active young single man as SHOPMAN, with a good knowledge of garden, flower, and agricultural seeds. Apply by letter, stating salary required to K. Messrs. Hurst & Son, 152 Houndsditch, London.

WANTED, as SEEDSMAN, an active Man, accustomed to the Retail Farm Seed Trade.—Full particulars and experience to F. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Temporary Engagement.

WANTED for a few weeks in a florist's shop, a young LADY who is experienced in all kinds of cut-flower mounting. Apply to B. MALLER & SONS, Burnt Ash Lane Nurseries, Lee, S.E.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

RICHARD SMITH AND CO.

beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

S ANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

Gardeners, Farm-Bailiffs, Foresters, &c.
DICKSONS, Royal Nurseries, Chester (*Limited*), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

THE LIVERPOOL HORTICULTURAL COMPANY (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, near Liverpool, wish to recommend to any Nobleman or Gentleman who may require a thoroughly competent and reliable HEAD GARDENER, David Lindsay, who was Head Gardener for the last twelve years to the late Sir Thomas Edward Moss, Bart., of Otterspool, near Liverpool.—Full particulars on application to the Company.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

GARDENER (HEAD), age 29, married when suited; where four or five others are kept.—W. H. DIVERS, head gardener to J. P. Hopwood, Esq., will be pleased to recommend his foreman to anyone requiring a good man, thoroughly experienced in all branches of the profession, and used to the management of men and the usual routine of a good establishment.—Ketton Hall, Stamford.

GARDENER (HEAD, or otherwise).—Age 35, married; twenty years thoroughly experienced in Early and Late Forcing Fruits, Flowers, and Vegetables. Excellent testimonials.—B. S., West Mill, Buntingford, Herts.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 30, married, no family. Sixteen years' experience in all branches. Good references.—GEO. DRAKE, Law-on Road, New Catton, Norwich.

GARDENER (HEAD WORKING); age 40, married when suited.—Mr. COOMBS, Head Gardener to the Earl of Dudley, Hinsley Hall, Dudley, can with confidence recommend his Foreman to any Gentleman requiring the services of a thorough practical man, experienced in all branches.

GARDENER (UNDER), Inside and Out.—Age 23. GEORGE HARBING, Maudiff Court Gardens, Abergavenny, can highly recommend a steady young man as above. Has been with him three years, and given him every satisfaction. Bothy preferred.

N. E. OWEN, Gardener to Lady Sutton, Conisburgh Abbey, Whitechurch, Salop, can confidently recommend C. Powell as FOREMAN (age 24), and T. Robinson as FIRST JOURNEYMAN (age 23) to any Gardener requiring the same.

IMPROVER, under Glass, or as GARDENER (UNDER), where three or more are kept.—WILLIAM PHILLIPS, Gardener, Kelsale Rectory, Saxmundham, Suffolk.

IMPROVER, under good gardener.—Age 18. Three years in London nurseries. Good char. etc.—C. C., 2, Wellesley Terrace, Higher Wellesley Road, Torquay.

TO GARDENERS.—Wanted, by a respectable lad, age 16, situation in a gentleman's garden. Two years' experience in stove and greenhouse. Bothy preferred.—J. CURREY, Milford Hill, Salisbury.

TO MARKET GROWERS.—MANAGER.—Experienced in Grapes, Tomatoes, Cucumbers, Chrysanthemums, Palms, Ferns, Cut Flowers, Grafting, Tea Roses, Clematis, &c. Twenty years' experience.—REX, 1, Grove Road, Mitcham.

SEEDSMAN.—One of the leading Houses in America REQUIRES the services of an experienced MAN, capable of taking charge of the Warehouse Department. A good position will be given to an energetic thoroughly-experienced man. None other need reply. Address, by letter only, stating age, experience, and references, also salary required, to GARSEED, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN, SALESMAN, or MANAGER.—Age 28; experienced in Wreaths, Bouquets, Plants, Seeds, Sundries, Book-keeping, &c. Energetic Salesman, with excellent references. Moderate salary.—FLORIST, 4, Ellerbe Road, Clapham.

HOLLOWAY'S PILLS.—Liver, Lungs, and Kidneys.—Most diseases of these purifying organs arise from obstructions, over the removal of which these celebrated Pills exercise the most perfect control. A course of them is strongly recommended as a remedy for such chronic affections as liver enlargements, congestion of the lungs, torpidity of the kidneys, and other functional disorders which cause much present suffering, and if neglected lay the foundation of organic diseases. Holloway's Pills are specially adapted for the young and delicate; their gentle and purifying action ranks them above all other medicines. In indigestion, nervous affections, gout, and rheumatism these Pills have achieved for themselves universal fame. They expell all impurities from the blood, and thus restore cheerfulness and vigour.

THOMAS GREEN & SON, LIMITED,

SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

TESTIMONIALS.

MESRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 25,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

Yours faithfully, (Signed) G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.
